In an action for injury to land by deposit of water, muck, and rock from an ore-washer, testimony detailing the injuries to the land and stating its value before and after the injury was done, is admissible. The jury is then left to infer the damages to be assessed. If the jury found that plaintiff's land was damaged solely by the acts of defendant in depositing thereon such water, muck, and rock from defendant's ore-washer, then the defendant was properly held responsible for the whole of the damages.

Tennessee Coal, Iron & R. Co. v. Bunn (Alabama), 79 Southern, 360. June 20, 1918.

Coal Lease—Forfeiture—Waiver

Where defendant in violation of the terms of a lease made no bona fide effort for five years to mine coal on land leased from plaintiff, there was such an abandonment as would entitle the lessors to cancel the lease. Where, however, instead of commencing a suit for immediate cancellation, the lessors wrote the lessee urging him to sell his rights thereunder so as to enable development to take place, and merely threatened to sue for a cancellation, and immediately upon receipt of said letter the lessee entered into operating arrangements and proceeded to develop the mine, the lessors were held to have waived their right to claim a forfeiture, and suit for the same filed after the lessee and his associates had expended large sums in placing machinery on the ground and commencing operations in good faith, was denied.

Schmidt-Blakely Coal Co. v. Hembree (Arkansas), 205 Southwestern, 111. July 1, 1918.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Philip Argall was recently at Rico, Colorado.

Philip N. Moore has returned from Washington to St. Louis.

F. LeRoi Thurmond has been examining mines near Broad Pass, Alaska.

D. M. Riordan has returned to San Francisco from Hanover, New Mexico.

Henry D. G. Reynolds has returned to New York from the Altai region of Siberia.

Robert Hay Anderson, of Mexico City, is at the St. Francis hotel, on a short holiday.

T. Skewes Saunders, manager of the Dos Estrellas, has returned from London and Paris to El Oro, Mexico.

Stanly A. Easton and **Louis S. Cates** have been nominated directors of the American Institute of Mining Engineers.

Andrew C. Lawson, Professor of Geology in the University of California, is on his way to France to serve with the Red Cross.

Edwin J. Collins of Duluth has finished some examination work near Tonopah, Nevada, and is now near Saltese, Montana.

E. P. Crawford, of Silver City, New Mexico, has been commissioned First Lieutenant in the 428th Engineers and is now at Camp Cody.

It is stated officially that **H. A. Guess** is **not** to replace **C. B. Lakenan** at the Nevada Consolidated and Mr. Lakenan is **not** going to Chile.

George B. Wilcox, formerly chief watchman for the Calumet & Arizona company, is now Major in the Army and is stationed at Camp Greene, North Carolina.

Sidney J. Jennings, President of the Institute, is expected in San Francisco about November 13 and if the influenza regulations do not interfere he will deliver an address before the Local Section of the Institute on that date.

Winthrop R. Cady, sales manager of the Colorado Iron Works Co., died at Salt Lake City on October 25 of pneumonia following influenza, aged 31. Mr. Cady had a record of 17 years' continuous service with the Colorado Iron Works Co., and had a wide acquaintance among the metallurgists and mining men of the West.

Clarence S. Verrill, **C. E. Watson**, and **G. C. Randolph**, the two last representing the Mining Corporation of Canada, were lost when the 'Princess Sophia' sank near Skagway, Alaska, on October 25. They were returning after having examined the Engineer mine at Atlin, B. C., the owner of which, **Capt. James Alexander**, was also lost, with his wife.

Howard S. Lee died of influenza at Silverton, Colorado, on October 25. He was widely known throughout the West as a mining engineer of marked ability. He was the son of Mrs. D. K. Lee of 1763 Williams St., Denver, and was born at Golden, 38 years ago. He attended East Denver High School, Dr. Holbrook's Military Academy at Ossining, New York, and finished his education at Stanford University, where he was prominent in athletics. Ten years ago he became associated with the United States Mining, Smelting & Refining Co. and has managed several properties for that company. Until recently he was general manager of the Leadville unit, the unwatering project undertaken on Fryer hill by the United States company three years ago. He had recently been promoted to the position of assistant to the chief consulting engineer and expected to leave soon for his headquarters at San Francisco.

THE METAL MARKET

METAL PRICES

San Francisco, November 4

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	15
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	8.30—8.80
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$120
Spelter, cents per pound	11.50
Zinc-dust, cents per pound	15

ORE PRICES

November 4

Chrome, no definite quotations available.	
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% MoS_2	$1.25
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, per unit	$20—$26

EASTERN METAL MARKET

(By wire from New York)

November 4.—Copper is unchanged. Lead remained unaltered all week. Spelter is quiet and steady.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government has fixed its maximum at 48.81 pence for metal 925 fine.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, which have since been extended to January 1, 1919, prices to be effective on the day of shipment, not the day of sale. Quotations in cents per pound are as under:

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefore $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

ORES (New York)

Ferro-chrome. Quotations in this market are 40 to 42c. per lb. of contained chromium in the alloy having 4 to 6% carbon with 35 to 37c. asked for that having 6 to 8% carbon.

Manganese. High-grade ore, 48% and over, has been offered for import at $1.15 per unit, a new low quotation.

Manganese Alloys. Ferro-manganese is quiet and easy at $250, delivered, for 70% alloy with spiegeleisen also quiet at $75, furnace, for 16% and $80 for 18% alloy. These quotations could all probably be shaded. There is no desire to buy except for urgent near-by needs.

Tungsten. Prospects of peace are having some effect in this market, causing hesitancy. The influence of importations of Chinese ore is also felt, according to one authority. Sales in moderate quantity of high-grade ore have been made at $26 per unit in 60% concentrates. Imports from Bolivia have declined. Small lots of good-grade ore are being offered at $21 to $22.50 per unit. Ferro-tungsten is quoted as high as $2.60 per lb. of contained tungsten, but the exact state of the market is hard to gauge.

Eastern Metal Market

New York, October 30.

An easier tone is manifested in those markets that are not ruled by fixed prices, but they are all dull.

The present price for copper has been continued unchanged from November 1 to January 1.

The tin market is lifeless and consumers are awaiting developments.

Conditions in lead are unchanged and the market is under strict control.

Zinc has fallen gradually, with demand very light and prices nominal.

Antimony has declined further in a dull market.

Movements toward peace are bringing rapidly to the front readjustment questions in the steel trade; nevertheless the industry is apparently going ahead at full steam as though the War were to last indefinitely. The expectation of an early peace is reflected in some moves affecting steel. Conflicting currents naturally are confusing. Steps taken in the shipbuilding program in the past week mark the passing of this part of the war program from the wasteful stage toward a basis of economic production. The most efficient yards will be pushed to capacity output but high-priced ones will not operate much longer. Some shipyard extension plans have been cancelled. The output in October of both pig-iron and steel, despite influenza, has exceeded that of September, says the 'Iron Age.' Italy has bought 10,000 four-wheel gondola cars and the 40,915 steel cars for our forces in France has been distributed to 17 American car-makers.

COPPER

It was expected that there would be a meeting on October 25 at Washington to decide as to a new price for copper to rule after November 1, but it was called off. Early this week came the announcement from the War Industries Board that the present 26c. price would continue in force as a maximum until January 1 from November 1. It is understood that the decision was made after an acquiescence by the leading producers. Much depends on international developments as to what will be done about a price to rule after January 1. When peace comes new conditions must be faced and this industry is already preparing, in thoughtful consideration at least, for the new conditions. The influenza epidemic has seriously checked copper output of all kinds. The extent is variously estimated, some putting the decline in production at mines, smelters, and refineries at as high as 20%, due to the inroads of the epidemic alone. Casting copper has been selling at under the fixed price, revealing a surplus as compared with Lake and electrolytic.

TIN

There is little of fresh interest to report. Conditions are practically unchanged from those obtaining a week ago. Consumers are apparently well stocked with contracts, arrivals during the past few months having been liberal. They are buying only what is necessary, pending definite announcement as to Government international control of tin buying and selling. It seems less probable now that a price will be fixed immediately or even in the near future. An official announcement from Washington says that such a statement will come from London where the headquarters of the international pooling arrangement exists. There have been a few sales of small lots of metal en route or spot for about 76c., New York, which is now the nominal quotation. As to import licenses, all new ones are to come only through the U. S. Steel Products Co. It appears, however, that there has been a little relaxation as to other import licenses to those importers having contracts, a few such licenses having been granted, it is said. The belief prevails that such licenses will be granted to take care of all contracts made up to October 1. A Tin Importers' Association has been formed as a result of several meetings in New York recently; it is made up of representatives of all the American and Canadian importers; it has been incorporated, but no announcement has yet been made as to its further plans. Tin arrivals at Pacific ports thus far in October have been 3025 tons, with 475 tons credited to Atlantic ports. For the first time in a long time the London market is unchanged for the week, spot Straits having been quoted yesterday at £334 per ton.

LEAD

There have been no new developments. The metal is scarce with little prospect of any relief for some time. The situation is entirely in the hands of the Lead Producers Committee and were it not for the excellent manner in which the market is being handled there would be much confusion and complaint. By agreement, prices are maintained at a maximum of 7.75c., St. Louis, or 8.05c., New York.

ZINC

It is probable that peace talk has had more effect in the zinc market than in any other. Consumers are reminded that this metal sold very much lower before the War, but those who have studied the present situation do not expect to return to pre-war prices very soon. Costs at present are said to be not far below some of the present prices. Demand has fallen to small proportions the past week and most producers are believed to be well sold up for the last two months of the year. Some grades are really scarce, but quotations are largely nominal in the absence of any real testing of the market. Prime Western for spot and nearby delivery is held at 8.75c., St. Louis, or 9.10c., New York, with November at 8.60c., St. Louis, or 8.95c., New York. For December the quotation is nominal at 8.50c., St. Louis, or 8.85c., New York. There are a few who are offering for first quarter delivery at 8.12½c., St. Louis, or 8.47½c., New York, but there is not much eagerness yet to sell for this position. The weekly Government report of output and stocks is reported to be disappointing, showing for the week ended October 19 only a slight recession in both stocks and production of all grades. Grade A zinc is fixed at a maximum of 12c. per lb., base, but it has been sold frequently below this.

Zinc sheets are held at a maximum Government price of 15c. per lb. with zinc plates at 14c. per pound.

ANTIMONY

The Government recently is understood to have placed an order for 3000 tons, which, of course, has been distributed to various munition-makers. Consequently demand is light again and quotations have fallen slightly until yesterday they were 12.75 to 13c. per lb., New York, duty paid, for prompt and early delivery.

ALUMINUM

Government maximum prices control all dealings in No. 1 virgin metal and in scrap at 33c. per pound for 50-ton lots, at 33.10c. per lb. for 15 to 50-ton lots, and 33.20c. per lb. for 1 to 15-ton lots.

ORES

Molybdenum. The statement is made that a large business has been done for the account of our own Government and that of Canada, mainly of a low-grade ore, the sales going at considerably under $1 per lb. of MoS_2. High-grade material is held at $1.10 nominal.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

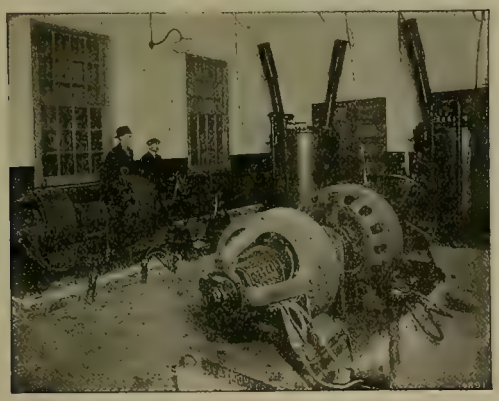
ELECTRIC TREATERS FOR SMELTER FUMES

The tubes containing the high-tension electrodes, and through which the flue-gases pass, are arranged in six groups. The electrodes are suspended at the top from a rack which provides ample insulation, and are connected with the high-tension direct-current line at the bottom. Disconnecting switches permit the current to be cut off from any group to permit inspection and repairs. The gases from

VIEW OF TREATER WITH 13-FT. FLUES DIRECT TO STACK AND TREATER

the furnaces pass through pipes 13 ft. diam., a Y with valves being provided so that the gases can be made to go either through the treater or directly to the stack as desired.

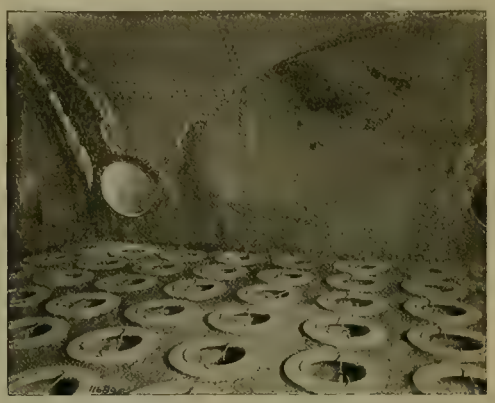
It is stated that tests show that over 90% of the flue-dust can be removed and that the value of the copper, zinc, and other metals recovered will within a short time pay for the treating equipment. It is calculated that at full load ½-ampere high-tension direct-current is needed.



WESTINGHOUSE MOTOR-GENERATORS, TRANSFORMERS, AND RECTIFIERS

Generating Equipment: Two 40-kva. 60-cycle, single-phase Westinghouse generators operating at 1800 r.p.m. arranged to deliver voltage ranging from 150 to 250 volts. A direct-current power line supplies excitation current. A 50-hp. 230-volt, direct-current motor drives each generator.

The transformers are of 40 kva. capacity, 200 volts low tension and 100,000 volts high tension. Additional taps are provided from which voltages of 50, 62½, 75, and 87½% of the maximum voltage can be obtained, the full capacity of the transformer being available on each tap. The high tension leads pass out from the transformers through condenser-type bushings, which are made up of alternate layers of metal foil and insulating material and provide a higher degree of insulation than can be obtained from any other form of construction of the same diameter. Choke coils are located inside the transformers to smooth out the static



INTERIOR OF TREATER SHOWING ELECTRODES SUSPENDED IN TREATER TUBES

surges that are liable to occur on the high tension line. To the motor-generator shafts are coupled the rectifiers for transforming the high-tension alternating current into direct current.

Control Apparatus: The Westinghouse switchboard consists of two panels, one for each generating and transforming set. Each panel carries a circuit breaker from top to bottom on the line between the generator and transformer, an alternating-current ammeter and voltmeter, a switch to reverse the polarity of the high-voltage direct-current, a motor field and line switches, a generator field rheostat, a five-point switch for making connections with the five high-tension taps of the transformer, and the motor starting-rheostat.

The voltage of the high-tension direct-current must be varied according to the condition of the flue-gases being treated. The transformer taps provide the large steps for this variation and the voltage adjustment of the generator the small steps. In addition a bank of adjustable resistance is connected in series with the low-voltage alternating cur-

rent which acts as a ballast and permits of further adjustment of the voltage. These banks are located on each side of the switchboard. Resistance is also provided in series with the high-tension direct-current line by resistance tubes mounted above the rectifiers.

Auxiliary Synchronous Motors: Under ordinary operating conditions, the motor-generators described above are employed so that there is no direct connection between the high-tension direct-current and the power lines of the plant; but in case of emergency, current from the alternating-current lines can be fed into the transformers and used to provide the high-tension operating-current. Under such circumstances the rectifiers driven by the generators cannot be used, so in their place are employed auxiliary rectifiers driven by 2-hp. Westinghouse synchronous motors which keep the rectifiers in synchronism with the current being rectified.

In its last issue the **Standard Oil Bulletin** took occasion to commend the patriotism of the 2205 Standard Oil Co. (California) boys who had entered the army and navy of the United States, as well as the loyalty of those who kept their shoulders to the wheel of one of the most essential of all war industries. The employees of the company have again shown their loyalty by their fine answer to the call for subscriptions to the Fourth Liberty Loan. Advices to the San Francisco office of the company indicate that its 13,000 employees have practically all subscribed, and the amount of bonds taken, either through banks or with the company's assistance, will approximate $2,600,000. This is an average of $200 for each employee. At one refinery more than $300,000 was subscribed by the men, more than the entire allotment for the city of some 25,000 population in which the refinery is situated. In one district 997 Standard Oil field workers out of a total of 1003 subscribed $373,500, an average of $375 per man. The six non-subscribers are foreigners. From Alaska, Washington, Oregon, Honolulu, Arizona, and throughout California the report is the same. Men and women alike have all subscribed, with exceptions too rare to be worthy of notice. The company subscribed for $3,500,000 of the Fourth Liberty Loan bonds. With its employees, it is the largest subscriber in San Francisco, the largest in California, and the largest in this Federal Reserve District. That its own subscription could properly be made as large as it is was a matter of great satisfaction to the board of directors, but infinitely greater is the gratification of the board of directors at the splendid response made by the employees of the company, and at this practical demonstration of their loyalty to their country.

W. H. Wanner, representative of the **Dixon** San Francisco Sales Office, has made the following report on the eleven years' service given by Dixon's silica-graphite paint on the lighthouse buildings at Port Oregon, Oregon: The United States Lighthouse Inspector has two buildings, which are 50 ft. wide by 100 ft. long, with regular gable roofs which were painted eleven years ago with Dixon's silica-graphite paint, and, from present indications, will not require repainting for three or four years to come. These buildings are at what is known as Tongue Point Lighthouse Depot at Tongue Point, Oregon, three miles from Astoria, Oregon. The paint is subject to salt air, sea air, and other severe conditions, and the long service it has given has convinced those in the department interested in painting that there is only one paint, and that is Dixon's silica-graphite paint.

NEW CATALOGUE ON WOOD-STAVE TANKS

The Pacific Tank & Pipe Co. has issued catalogue No. 12, treating of wood-stave tanks for mining, milling, metallurgical, and other purposes. It contains detailed information on general subjects of tank specifications, standard dimensions and capacities, list prices, and telegraphic codes for convenience in ordering. Specific examples of actual

75-TON CYANIDE PLANT AT BLYTHE JUNCTION, CALIFORNIA

installations are also described and illustrated. The view given herewith shows a 75-ton cyanide plant of the Assets Realizing Mines Corporation at Blythe Junction, California, a typical wood tank installation on the desert, unprotected by building or roof. The Pachuca type agitating tank also shown herewith is of all-wood construction with the exception of the bands and air-lift pipe. Accessory apparatus and supplies are also fully illustrated and described, while general data, weights, and measures, metallurgical and chemical formulas all prove to be most useful. This catalogue is for general distribution gratis, and a copy may be obtained by writing to the company at 318 Market street, San Francisco.

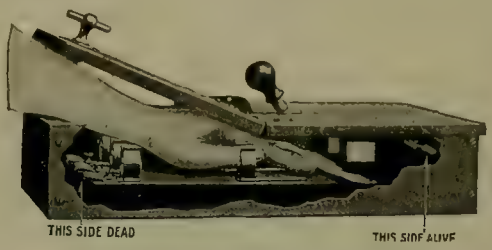
PACIFIC REDWOOD PACHUCA TANK

A SAFETY SWITCH

In many steel mills, factories, mines, and similar industries where most of the workmen have little knowledge of electricity, it is desirable to use switches having no live parts exposed or accessible in the ordinary operation of the switches or when replacing fuses.

This is accomplished in the Krantz auto-lock switch, marketed by the Westinghouse Electric & Mfg. Co. It is intended for use on main circuits or wherever an ordinary knife switch is applied. The switching parts and fuses are enclosed in a steel box, the cover of which is in two parts, one being screwed on to form a permanent covering for that end of the box containing the switch, and the other part being hinged so as to swing back and permit the renewal of fuses, which are located in this portion of the box. An ingenious latching mechanism makes it impossible to open the cover without first throwing the switch to the 'off' position and rendering all fuses and other accessible parts dead. Thus fuses may be replaced at any time with absolute safety. As long as the door of the case is open, the switch contacts cannot be closed.

By using a padlock, the switch handle can be locked in the 'off' position, making it impossible for any one to close the switch, except the person holding the key to the padlock. By using another padlock, the cover may be locked, so that



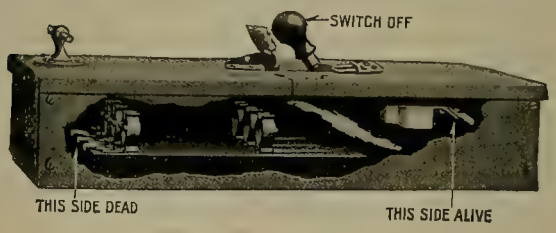
KRANTZ AUTO-LOCK SWITCH, LOCKED IN OPEN POSITION

the fuses cannot be tampered with. Either of these padlocks can be used independently of the other, so that the switch cover can be locked shut with the switch either 'on' or 'off', or the switch can be locked in the 'off' position with the cover either locked or open.

Contact is made by means of a laminated spring copper brush, double ended with auxiliary arcing contacts at each end. The outer leaves of the brush are bronze to provide additional spring pressure.

The stationary contacts are of hand-drawn copper and are mounted on slate bases, one of which in the fused switch carries one of the fuse clips while the other forms the terminal block for the incoming line and is mounted under the stationary portion of the cover.

The operating mechanism is galvanized steel of the toggle



IMPOSSIBLE TO TOUCH LIVE PARTS

type, and is attached to the under side of the stationary end of the cover. This mechanism can be easily removed for inspection by removing several screws.

In closing, the pressure between the contacts causes the laminations of the brush to spread apart, giving it a wiping or self-cleaning action.

The double-ended brushes provide a double break, dividing the arc between the two ends, each of which is provided with a separate arcing tip.

In the closed position the switch is held in positive contact by throwing a toggle over centre. A spring provides a quick-break for opening, the mechanism being independent of the operating handle.

These switches are supplied for 250, 500, and 600-volt, for either alternating or direct-current service, and in capacities up to 2000 amperes.

The safety features of this switch have been recognized by the American Museum of Safety which has awarded it a gold medal and special mention.

DUPLEX TRUCKS

Drilling for oil is a man's size job that requires ponderous equipment. Previous to the advent of the Duplex, most of this work was too strenuous for trucks and had to be done slowly and clumsily by three or four teams of horses. But the 4-wheel drive is changing that. In the Oklahoma fields, especially, the Duplexes sold by the **Stapleton Motor Sales Co.** are performing difficult tasks.

In the illustration, a Duplex is shown hauling a load of lumber over a road that resembles the Missouri river far more than the usual conception of a highway. This truck

DUPLEX TRUCK HAULING LUMBER

has covered about 10,000 miles in the past year. The load pictured consists of 4200 feet of lumber, weighing 13,700 pounds.

Oil-drilling involves much moving of giant boilers from one place to another. In one case the Sinclair Gulf Co.'s 12,000-lb. boiler was moved a distance of 2700 ft. by a Duplex in less than 15 minutes; another three-team job. At another time an oil-pump, weighing 8000 lb., was loaded on the truck by means of a winch and moved to a new location in an hour. The loading alone would have required half a day had horses been used. But the star performance is the dragging of a 100-bbl. oil-tank, weighing 8000 lb., and half full of oil.

Every mining superintendent and engineer who uses belting for power transmission knows that the product of modern methods is vastly superior to that of a generation ago. Yet a large proportion of the increased service possibilities of this better belting is lost because old-time methods of joining are persisted in. Knowing that the busy man enjoys a shaft of humor even when it strikes his own practices, the **Crescent Belt Fastener Co.** has just issued a booklet which treats of the serious subject of belt joining in a humorous way. This 24-page booklet, entitled 'Gone Again', is written in the way of a 'movie' comedy, and may be obtained at the Sales Department, Crescent Belt Fastener Co., 381 Fourth Avenue, New York.

The Chicago Pneumatic Tool Co. announces the appointment of A. M. Brown as district manager of sales, 1740 Market street, Philadelphia, succeeding G. A. Barden, who remains in Philadelphia as sales representative for the company. For some time past Mr. Brown has been located in the New York offices of the company as assistant manager, Compressor Sales Division. Announcement of changes in executive officers was made in a previous issue.

RECENT PUBLICATIONS

U. S. Bureau of Mines Bulletin 127: 'Gold Dredging in the United States,' by Charles Janin, 226 pp. A valuable monograph, enriched with many useful drawings.

Technical Papers From the Argentine Republic:

Annals of the Ministry of Agriculture, geologic and mining section. Vol. XIII, No. 1. Geology and hydrography of Bahia Blanca, and vicinity; accompanied by an economic-geologic map of the Argentine Republic on a scale of 1:200,000, section 35, sheet M; by Dr. Ricardo Wichmann, 1918.

Ditto, Vol. XIII, No. 2. Monograph on a petrographic study of the rocks of Argentina, with reproductions from enlarged micro-photographs of thin sections; by Dr. José M. Sobral, 1918.

Bulletin No. 9, Series D, mineral chemistry and mineral waters; the thermal waters of Rio Hondo, Province of Santiago del Estero; by Dr. Hércules Corti; with numerous maps and photographs; 1918.

Bulletin No. 17, Series B, geology; investigation of the tectonic structure of the imbripheral basin of the Rio de la Rioja, with reference to its effect in diminishing the water supply for that river; by Dr. Juan Rassmuss, 1918.

Bulletin No. 10, Series D; the thermo-mineral waters of Villivicencio, Province of Mendoza; by Dr. Héctor H. Alvavez, 1918.

The Diesel Engine. By Herbert Haas. Bulletin 156, U. S. Bureau of Mines, Washington, D. C. Pp. 130. Ill., index.

The author discusses liquid-fuel engines and then takes up the Diesel engine in detail, including design, fuels used, lubricating-oil, relative equipment, examples of successful use, and types of American-made engines. This is one of the best presentations of this subject yet made.

Efficiency in the Use of Oil Fuel. By J. M. Wadsworth. Pp. 82. Ill., index. U. S. Bureau of Mines, Washington, D. C.

In 1917 it is estimated that 40,000,000 bbl. of fuel-oil, or one-fourth of the total amount used, was wasted through inefficient operation of boiler-plants. The present volume is the result of an endeavor by the U. S. Bureau of Mines, acting in co-operation with the U. S. Fuel Administration, to reduce this waste. The author considers the various features of boiler-plant design and operation and points out methods for obtaining efficiency. The text is supplemented by numerous illustrations and tables. The book is of convenient pocket size, and should be in the hands of everyone concerned with boiler-plant operation or design.

BOOK REVIEW

Steel Shipbuilders' Handbook. By C. W. Cook. Pp. 123, with four plates in insert. Longmans, Green & Co., New York. For sale by 'Mining and Scientific Press.' Price, $1.50.

This is a dictionary of several hundred special words and phrases used in the shipbuilding industry. Four plates are included, showing the principal parts of a steel ship. Where any terms given in the body of the book are illustrated in the plates the definition gives a reference to the particular plate. The book will be of great value to those interested in the steel shipbuilding industry, particularly the many thousand that were unacquainted with that industry until a few months ago.

AN INDEPENDENT WEEKLY PAPER OWNED, EDITED, AND MANAGED BY ENGINEERS

"JACKHAMER"
The Name of a Superior Rock Drill Service
YOU men who drill rock know the "Jackhamer"—know its capacity for speed work and its ability to stand up under severe conditions.
Many have recorded its performance and proven that "Jackhamer" renders the most economical hand hammer drill service.
"Jackhamer" wins its highest honors, not in record breaking sprints, but in plugging away month after month, maintaining a high average work output at a saving in power and upkeep cost.
You can advantageously employ this service in your mine. Wet and dry type Jackhamers available in several sizes.

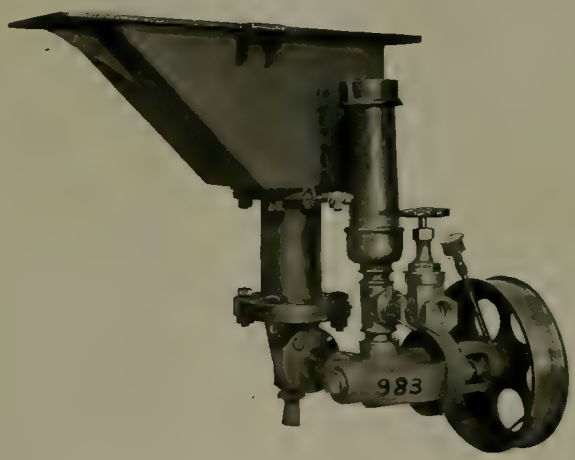
LAUNDER CLASSIFIERS

The Launder type Richards Pulsator Classifier is designed to meet the demand for an inexpensive device that will furnish a classified product for one table, or for 2, 3, 5, 10 or any number whatever. A classifier that may be attached to your already existing launder—at just the right location nearest the table or tables you desire to feed—to draw just the right amount from the pulp in the launder—classify it to make a perfect product for your table—and deliver it to the table in just the right quantity.



The Pulsator Valve is made in one size but fits any sorting column. Sorting columns are made in five sizes, viz: 2½, 3, 4, 5 and 6 inches diameter. Settling pockets are made in six sizes to fit different sorting columns.

NOTES 645

THE DAY 646

The signing of the armistice and the end of the War. Solemnity of the occasion and seriousness of the feelings prompted by the great event. The frustration of a mad ambition and punishment for a colossal crime. Gratitude to our soldiers, living and dead. M. & S. P., November 16, 1918.

AN OLD STORY 647

The persistence of ore in depth, as discussed by the chairman of a South African copper company in London. The value of predictions concerning persistence in the face of brutal facts. M. & S. P., November 16, 1918.

REGULATIONS FOR PUBLISHERS 648

The regulations to which this paper has had to conform by order of the Post-Office Department. Subscribers in arrears, advertisers, and others affected by these regulations, some of which are salutary. M. & S. P., November 16, 1918.

DISCUSSION

FROM THE FRONT

By E. G. Snedaker 649

A letter from a young mining engineer, now Lieutenant in the American Expeditionary Force. Reflections and observations concerning the actual fighting. M. & S. P., November 16, 1918.

THE GOLD PROBLEM

By W. de L. Benedict 650

An accepted authority corrects sundry phrases used in a previous article by another writer. The fixation of the price of gold by England and the monetary price of the metal today. M. & S. P., November 16, 1918.

ARTICLES

THE GOLD DISTRICT OF VENEZUELA

By H. Huntington Miller 651

A short description of a gold-mining district once famous by reason of the output made by the El Callao mine. The geography, geology, and climate are discussed, and reference is made to the gold mines now in operation. M. & S. P., November 16, 1918.

SAMPLING AND ANALYSIS OF CHROMITE

By Abbot A. Hanks 654

A distinguished San Franciscan chemist and assayer furnishes a convenient and rapid method of analyzing chrome ore. M. & S. P., November 16, 1918.

MANGANESE AND PYRITE 655

Part of the testimony of Philip N. Moore before the Committee on Mines and Mining of the U. S. Senate. M. & S. P., November 16, 1918.

OIL IN SAN FRANCISCO 656

How oil was struck in making excavations along the water-front. M. & S. P., November 16, 1918.

COLUMBIA UNIVERSITY IN WAR-TIME 657

Illustrating the loyalty of the students. M. & S. P., November 16, 1918.

PRODUCTION OF GOLD AND SILVER IN THE UNITED STATES DURING 1917 657

The latest official statistics. M. & S. P., November 16, 1918.

COPPER DISTRIBUTION OF MEXICO 658

A map showing the distribution of copper mines in Mexico, by Luis C. Espinosa. M. & S. P., November 16, 1918.

CALCULATING TRAVERSES WITHOUT TABLES

By A. J. Sale 659

An article by an experienced engineer showing how any kind of surveying problem can be solved without the use of logarithmic tables. M. & S. P., November 16, 1918.

-and here is the latest WILFLEY Improvement!

Wilfley Rocker Bearing

Ease of operation—reduces friction—50% less H.P.

Over twenty years ago the Wilfley Table revolutionized milling practice. The Wilfley principle originated efficient concentration in the metallurgical field and is today the leader in producing the most satisfactory results.

Many improvements have been added at various times, but during all these years the original Wilfley principle has not been changed.

The most recent Wilfley improvement is a New Rocker Bearing, designed primarily for use with the No. 9 Double Deck Wilfley Table. Of the rocker type, it performs the functions of a roller bearing. It reduces power consumption to a minimum.

The New Rocker Bearing cuts down friction and eliminates undue strain on the head motion. Like other Wilfley improvements you will find the New Rocker Bearing a practical help and a valuable aid in keeping table maintenance at a minimum.

Our engineers will be pleased to explain the operation of the New Rocker Bearing in detail. They also offer their services to assist you in the solving of your concentration problems.

EDITORIAL

"MINE eyes have seen the glory of the coming of the Lord." We salute the dawn of a better day, and thank God that the long-drawn horror is past.

AT this eventful hour we feel sorry for the older generation that died during the period of the War and missed the supreme satisfaction of witnessing its victorious conclusion; so also we feel sympathy for those of the younger generation that enlisted as soon as they were able and yet were deprived of the opportunity to do service at the Front. On the other hand we envy the news-boy that is privileged to shout "Abdication of the Kaiser!" "End of the War!" "Wuxtry!"

SAN FRANCISCO lost more lives in the epidemic of influenza than in the earthquake-fire of 1906. The death-list is given as 1605; the total loss due to earthquake and fire in San Francisco and the neighboring communities was about one thousand.

IT is announced that the Supreme Court of the United States has granted a writ of certiorari for a review of the decision of the Ninth Circuit Court of Appeals in the case of Minerals Separation v. Butte & Superior Mining Company.

FOUR more articles on the Utah Copper enterprise, dealing with milling, leaching, and smelting, will appear at an early date. Delay in publication has been caused owing to the collection of the necessary illustrations.

CAMBRIDGE university gave 14,840 of its members to the British army and of these 8407 are casualties, the killed numbering 2382. This is a noble sacrifice and reminds us that Harvard, the younger Cambridge, has shown an equally fine spirit, although not called upon to make a sacrifice so great as the sister university.

DESPITE the recent protestation of the German government against the imputation of inhumanity and barbarism in the waging of war against civilian population of invaded countries, it is clear from numerous trustworthy reports that the people of the evacuated districts in France and Belgium have been subjected to the now familiar German methods of destroying private houses before retreating, of driving their inhabitants like cattle into the fields, of looting, and of bestialities unmentionable. For all this they will be held to account, more particularly the officers in command. We note that the British Home Secretary, speaking in the House of Commons, on November 5, stated that the names of those responsible for such acts will be demanded by the Allies and that they will be brought before a proper court for trial and punishment. It is high time for an outraged civilization to assert itself and for the doctrine of individual responsibility to be enforced.

IF Germany falls into political chaos, the War will have what boating-men call a dirty finish. To make peace with or to exact indemnity from a Bolshevist mob is impracticable. We hope that the transition from Prussian autocracy to some form of popular government may be effected without the entire disruption of social order in the late German empire. The greater literacy and the habits of discipline of the German people ought to keep them from falling into anarchy. We want to see an organized Germany able to make an accounting for her misdeeds, not a politically drunken sot that cannot be held responsible.

CHANGES made recently in the personnel of Señor Carranza's government at Mexico City are said to indicate a trend of sympathy away from German propaganda and a turn toward pro-Ally influence. We are informed that conditions in Mexico are improving steadily, particularly on the west coast, where mining activities are increasing. Most of us have hoped that the end of the Great War would synchronize with the restoration of order in Mexico and we still hope that among the steps to be taken to make the world safe for democracy will be an effort to end the rapine and riot that are as dangerous to democracy as Prussianism itself.

A YEAR ago there was talk of sending American colliery engineers to assist in the rehabilitation of the coal mines in the Valenciennes region, which has now been cleared of its German despoilers. Unfortunately the long-continued fighting in this part of France, together with the wanton sabotage of the Germans, has wrought enormous damage. The photographs of Lens now appearing in the illustrated papers show to what

ruin one of the principal industrial centres of France has been reduced. In their possession of these fuel resources for four years and in their systematic destructiveness, the Germans have done an injury to France for which we hope to see them compelled to pay to the hilt. Meanwhile it is probable that the French will need, not engineers, for their own are thoroughly capable, but American machinery, particularly of the standardized type for which our manufacturers are pre-eminent.

WHILE going to press the terms of capitulation are published. The surrender is as complete and as abject as any of us could wish. They leave Germany helpless, and ensure the imposition of terms for perpetual peace. The compulsory evacuation of the region west of the Rhine is of tremendous import. The surrender of military material is on a big scale, and the expropriation of warships is not only large, but it includes practically all the submarines remaining in the Enemy's hands. Nothing is said about the crown properties or the private wealth of William of Hohenzollern and his family, but it seems reasonable to expect that the new government of Germany will avail itself of these resources to pay the indemnities enforced by the Allies in reparation for the damage done by the German armies in the countries they invaded and looted. Justice is being done.

RESENTMENT has been expressed generally against the hoax perpetrated by the United Press on November 7, when the president of that news agency, Mr. Roy Howard, sent a cablegram from Paris asserting that the armistice had been signed at 2 p.m. that day. The premature celebration incited thereby had the effect of rendering the real event something of an anti-climax. It is to be hoped that an official enquiry will be made into the affair in order to ascertain what motive prompted Mr. Howard's action or whether it was only an extreme phase of journalistic irresponsibility. Having issued the telegram in the morning, why did the United Press fail to confirm or correct it during the course of the day? Here in San Francisco the 'Bulletin' re-affirmed the mendacious news for ten hours. The sinister suggestion of a stock-exchange scheme obtrudes itself, seeing that there was a sudden rise in quotations, more than sufficient to enable unscrupulous persons to make a lot of money if they were aware in advance that the cablegram was to be sent. We recall the detailed story that circulated through the financial centres of Europe regarding the coup made by King Nicholas of Montenegro by agreement with a firm of brokers at Vienna to let them know a few hours in advance of his declaration of war against Turkey in 1912. We recall also the story that Von Bernsdorff made a fortune by acting in anticipation of the break in diplomatic relations between the United States and Germany in 1917. It is hard to understand how any intelligent and honest man could have done as Mr. Howard did; either he is an egregious fool or a scurvy knave. It seems worth while to ascertain the proper label. We are sorry that the United Press has discredited itself so thoroughly, because the event will help Hearst's lying press-agency and strengthen the Associated Press, which already has a control perilously near to being a monopoly of news distribution. Some measure of government control over the press-agencies is highly desirable for the protection of the public.

THAT bogus despatch of the United Press was a poor piece of journalism, apart from the decisive fact that it was false. It was worded in the language of a high-school sophomore. What need was there, in such a momentous message, to state that "the German delegation had come into the Allied lines under a white flag." Would they enter under cover of a red flag? Again, Mr. Howard injects a description of Sedan as "one of the historic cities of Europe." Sedan is not a city but a battlefield; it is a small fortified town rendered famous by an event to which no descriptive reference is necessary. It is not worth while talking to anybody unaware of the association of ideas evoked by the word Sedan.

AMID the blatant newspaper exaggerations of American performances in the War, it is gratifying to read the testimony of such a competent critic as Mr. Frank Symonds to the achievement of Pershing's army northwest of Verdun and along the front from Metz to the Argonne. This was the hinge of the big swing made by the German armies in their retreat and at this hinge was concentrated their most bitter resistance. From September 26 to the finish the Germans had to rush division after division to that part of the front to stay the American offensive, thereby weakening the opposition to the British attack on the Hindenburg line and their subsequent advance into Belgium. For four weeks our boys, including Californian units, fought the Enemy's veterans in the wastes of the Argonne and drove them back step by step after the most intensive fighting. On November 1 the German line was broken and the road to the Middle Meuse was opened. This was one of the major operations of the War and greatly to the glory of our First Army.

The Day

The hour of triumph finds many of us disinclined to be noisily jubilant; we accept the succession of tremendous events with quiet exultation and deep gratitude. The relief is so great and the victory so complete that ordinary gestures of delight seem unfitting. It is as if someone dearly beloved and long in the grip of a fateful illness had finally been declared by the doctors to be out of danger; it is as if a mad dog after running amuck during long days and nights had been killed. At last the Pan-German menace has been thwarted, the armies and navies of the Allied peoples have conquered, the orgy of bestial violence is ended, the law of civilization has been asserted. In the days before Armageddon, long

before we dreamed of the horrors they were preparing to bring upon the world, the Germans toasted 'Der Tag', the day when they were to goose-step across creation, when they were to impose their notion of things upon a subjugated world. Their paranoiac chief talked frothily about the German sword and spoke insolently about his partnership with a tribal god. We thought it merely the eccentricity of a feudal king and the heady conceit of a successful people until, almost too late, nation after nation had to face the grim reality of wild talk that was translated into wilder deeds. Now that nightmare has gone; we awaken to a sane world; 'The Day', not 'Der Tag', has dawned and we salute the sunrise of a happier dispensation. The German marauders have been beaten, we have frustrated their mad design, and we give thanks to God that the horrible menace has passed. Each of the associated enemies has capitulated, the leader of the great conspiracy has been driven from his ensanguined throne, and his captains have been forced, by a series of defeats on land and sea, to come humbly asking for a truce, the preliminary to an abject surrender. By a series of wonderful coincidences the pages of history have been re-written in the words of human freedom: an Allied army has been welcomed at Sarajevo, where was lighted the spark that set the world aflame; the victorious Italians have marched through the gates of Trent and Trieste; French and American troops have over-run Sedan and given a new meaning to a name of tragic memory; British armies have reached both Mons and Waterloo; the Belgians, the first to know the invader's heel, have the satisfaction of seeing him humbled in the dust of their own soil; where the German first proclaimed his disregard of all law, human or divine, there today his sword is broken and his honor abased. Never has history witnessed an end so shameful to so grandiose a scheme of conquest. It is true, the Germans made a courageous fight, wonderfully sustained, but it has been defamed for all time by the way they have behaved; it has been a brave fight, but a dirty one. The German military caste has not only failed utterly, it has been dishonored. The blood of helpless non-combatants, on sea as well as on land, of innocent women and children, cries to heaven from under the waves and from amid the ruins of devastated hearths far from the battlefield. We are as little willing to shake hands with our defeated enemy as with a burglar that has been caught in the act of murder; when we think of the millions of happy lives sacrified to stay his bloody hand, we feel less like a victor than a judge putting on the black cap to pronounce sentence. No sentiment of generous admiration for a fallen foe mixes with our joy today; on the contrary, that exultation is crossed with contempt for an opponent that did not play the game. But enough of him, let us turn to think of the immortal dead that lie in Flanders field and elsewhere in the wake of the victorious battalions that have borne our flag to victory; to them we rise today in silent salute: the thought of them restrains our hilarity, making us deeply sensible of the cost of victory and firmly determined to conclude such a peace as shall be worthy of their sacrifice in the cause of human freedom. To the hosts of the living, now standing to arms while the terms of capitulation are being enforced, to them we cannot say all that we feel, to them and to the gallant sailors that kept the seas against submarine piracy, we reach forth the warm hand of unspeakable gratitude.

An Old Story

In a recent issue of the 'Financial Times,' of London, we read an account of the annual meeting of the Messina copper company operating in South Africa and notable as one of the companies with which Mr. Hoover was identified until he resigned, as chairman, in order to devote himself to more important work. In the report of the speech made by the chairman, Mr. C. F. H. Leslie, who is well versed in mining affairs, we found a statement that arrested attention on account of the fact that it echoed a fallacy upon which it seems worth while to animadvert. The statement was as follows: "At times we have been much encouraged by finds of higher-grade ore, as well as by the view of Mr. Graton, one of the great base-metal geologists of the world, whom we consulted, that there was no inherent reason why we should not find as rich ore in the lower levels as in the upper levels of the mine. Yet we must look at this fact, that ever since the year 1913, although the tonnage of ore-reserves has sometimes shown considerable increases, the average assay-value of that tonnage has shown a constant fall from 10% [copper] in the year 1913 to 5.7% up to 30th June last." This explanation, by a conscientious director, has a pathetic interest particularly to those experienced not only in mines but in men, not only in ore deposits but in the organization of companies to exploit them. Here we have a copper mine that is giving unmistakable signs of impoverishment in depth, a chairman that is telling the truth to his shareholders, and a geologist that has been engaged to give advice at a critical juncture in the development of the mine. The setting is dignified and the *dramatis personae* are eminently respectable; obviously, this is not an opera-bouffe performance, but legitimate drama. Nevertheless, like Hamlet, the play seems to be full of quotations, for we recall having heard or read similar remarks on similar occasions in years gone-by. First, the facts: steady decrease in the copper content of the ore during five years as the mine has been deepened; patches of rich ore, reminiscent of the upper levels, in the deeper workings; a report by an eminent expert stating that there is no inherent reason" why the ore in the deepening workings should not be as good as it was on the upper levels. We hasten to say that the term "eminent expert" is quite properly applied to Mr. L. C. Graton and that if we were in need of geologic advice on the vagaries of ore deposition in a copper mine we would turn to him for help. The fact that he is an acknowledged authority on the subject merely serves to give point to the comment that we venture to make on the incident. We hold that there *is* an "inherent reason" for fearing impoverish-

ment in depth, because non-persistence inheres in the nature of ore deposits, as we know from the evidence of cumulative fact. The geologist may ascertain, by study of the structural conditions, that a lode or vein is likely to persist below a certain horizon, but it is not given him to predict the recurrence of rich ore once the zone of secondary enrichment has been passed in the course of deepening operations. The idle shaft-houses and abandoned workings of old mines all over the world afford eloquent, and derisive, denial of the alluring dictum that "There is no inherent reason why the ore is not as rich in the lower levels as it was in the upper levels." A mine is a wasting asset; its life depends upon an ore-body that is the product of the processes of Nature at work with infinite patience for a period, or for successive periods, covering tens of thousands, even millions, of years. Man digs into the metallic treasure so patiently and laboriously accumulated in the rocks; he removes it in a few years, or at most in the time of one of his brief generations. His process of exhausting the ore is swift, that of nature in making it is slow; the one is like the cutting down of a tree, the other like the growth of a giant of the forest. The impermanence of mines inheres in the non-persistence of ore.

Regulations for Publishers

As our readers are aware, newspapers and other periodical publications are classed as 'essential' at this time. This view of the usefulness of the press is eminently sane and democratic, for it is a recognition of the fact that, despite notable exceptions, the newspapers and other circulating pages of print have done great service in creating a healthy national spirit and in furthering the great cause to which every good citizen is committed. The press has been a tonic to the morale of the Nation, and if Hearst and other exponents of jaundiced journalism have proved true to form, they have served mainly to furnish a contrast. The work of clean journalism, as distinguished from the gutter press, has not been performed without serious handicap, of course. Shortage of raw materials has hindered expansion and penalized energy. An increase in the price of paper, in our case from 4¾ cents to as much as 10½ cents per pound, took place long before there was any excuse for raising prices. Profiteering marked the manufacture of paper early in the War; combinations of manufacturers exerted an illegitimate influence on the market as soon as there was an excuse for taking advantage of abnormal conditions. We were victimized like others. Later, the embargo on exports of pulp from Canada did create a shortage of paper, particularly news-print paper, not book-paper, such as we use, and the War Industries Board granted priority to the paper-mills in order to alleviate the condition of the trade. In doing so, the Board insists that no paper shall be wasted. The needs of the Government caused a shortage of sulphur, bleach, and freightage, thereby giving a reasonable excuse for a small rise in the cost of book-paper, and justifying the regulations issued by the War Industries Board for the conservation of paper. These regulations have killed a number of practices established by years of custom. Some of them are bad business and it is well that they should be stopped; for instance, all 'free' circulation is prohibited. In July the Post-Office issued an order that only one copy of a paper should be sent to an advertiser and only a copy of the issue in which the advertisement appeared. We were sending as many as 18 copies to single advertisers, that is, to their various branch-offices and agencies; now, if they want more than one copy, they pay for it like anybody else. Next a series of nine suggestions of a mandatory character have been made by the War Industries Board; for instance, every publisher is asked to limit his consumption of paper to 10% less than what he used in the year ended on June 30 last, such decrease being calculated upon the quantity he would have consumed had he used paper of the maximum weight prescribed by the Board, deducting from this amount half the quantity covered by the 'suggested' economies. The apparent deduction of 10% is actually about 22% in our case. The 'suggestions' also include the discontinuance of sending papers after the expiration of a subscription, unless paid in advance; no more complimentary copies; no free exchange between publications; no return of unsold copies from news-dealers; a reduction in the number of sample copies to 1% of the circulation; and no selling of papers with premiums unless the combined rate is at least the full price of the premium plus 75% of the published price of the periodical. Another interesting regulation is an embargo upon guarantees of circulation as a basis for the establishment of advertising rates. This is a salutary suggestion. The efficiency of a paper as a medium of publicity is not dependent upon the number of copies printed, issued, or circulated, but upon the extent to which the paper is read. An unopened copy or a copy set aside is barren of result to the manufacturer whose advertisement appears in that issue; on the other hand, a single copy may be read intensively, so intensively as to include the advertising pages, by a dozen people. No new publication may be established during the period of the War unless it be shown that it is necessary to the national purpose at this time. The combined result of these prohibitions and inhibitions will be to kill irresponsible and illegitimate publishing, but not to injure genuine business more seriously than is the share of everybody during this critical period. So far as the Mining and Scientific Press is concerned, the purchasing power of its subscription list has not suffered at all; several hundred subscribers have discontinued and gone to fight their country's battle overseas; we are proud to number them among our supporters; their places have been taken by older men or their duties have been merged temporarily with those of the technicians that remain at their former posts. We have doubled our subscription list during the last three years; this paper has been published for 58 years and it never had better support than today; we face the future cheerfully knowing that the national purpose will be fulfilled to the hilt.

From the Front

The Editor:

Sir—Let me start my note by asking your pardon for using a pencil. Ink is very hard to obtain when one is at the Front. I've just received the PRESS of August 10, and after reading it from end to end I felt I should just drop a line and try to tell you how much news of my own profession means 'up here'.

It would seem nowadays that the mining engineer has little place in the War, that is, if held strictly to his experiences in underground operations, but happily the training of mining men has usually been so broad that one finds them at home in almost any branch of military engineering.

Since the arrival of my regiment in France last May we have been quite active and have seen a large part of the country. On our arrival we were attached to the British and through their courtesy and splendid spirit of hospitality and general desire to lend a hand we started a period of training that unfortunately was ended in a short time. I say "unfortunately" because we were all beginning to understand one another and to brush away a lot of unfounded prejudices. They were finding out that all Americans were not typified by the pre-war tourist and we in our turn were learning that they were fine fellows and not the overdone comic-opera idea of the American playwright.

Soon we came in contact with the French and here, much to the surprise of many, we found less difficulty than had been expected. I've seen our boys spend hours with the French soldiers and talking with arms, hands, and feet, yet they seem to understand one another. A book would not hold all the amusing incidents that happened to us in learning the game of billeting. But all that has passed now, we're veterans, that is, with respect to the American Army, and have been in the line four times. Our division has been cited twice and is known as the shock unit.

Our baptism of fire was rather sudden, but glorious, for we took part in that memorable counter-offensive which marks the turning point of the War—that never to be forgotten 18th of July. At the time part of my regiment was hurriedly rushed up to the Front the night before the attack was to take place and part of it was set to work to improve the secondary defence line. Never shall I forget that day. We had received the news that all was ready. That morning I stood on a hill just behind the line watching and waiting. Suddenly at 4:30 our barrage opened. Guns were firing all around us. Rockets flew heavenward from the line. Aeroplanes began to arrive in countless numbers and as they flew over they signalled the balloons to arise. Then in the dim half-light we could make out their sausage-like shapes springing up like some huge fungus growth. Suddenly, as if to proclaim our 'Day' the sun came over the horizon in a burst of splendor and turned the sky to a brilliant crimson. Little did we realize then what it all would mean. Each day saw us move forward over the torn ground that had been held by the filthy Hun—an old story to many, but how new to us! August found us up against a stiffened resistance but still going, and at last we reached the Vesle river. Here was where we played our most important part. Our boys built bridges across the river for the infantry in the face of machine-gun fire, snipers, and gas. Thenceforward we were in the War and no mistake.

How sweet was relief when it finally came and when we found ourselves back in the rest area where we could have a light at night, a bed, a bath, and even hear a real American girl sing to us at the 'Y'. It seemed like heaven. All good things have an end and we're at it again.

Each time we go up our work is different. This time we built a road over the No Man's Land of four years and went over the top carrying artillery bridges. As I write our 'heavies' are pounding away at the Hun and shake the very ground about us. I've been living in a German dug-out for a week, and thankful for it too—especially so, as the other night Fritz seemed bent on putting some of us out of action. One shell landed fairly on top of the dug-out and, needless to say, we all turned over rather suddenly. Sometimes it seems as if his shells have eyes the way they seek one out.

By the paper today I see that they are trying for peace. There is only one way to get it, and we've told them how, otherwise it's useless for them to waste our time. September saw 312,000 men brought over, which seems to be a rather strong answer to any false steps the Hun may make.

I'm afraid I've written at too great length and failed to say what I had intended. Capt. Newberry and I are the only mining engineers in the regiment and how good it is to read of the doings in the mining world. Many times have we wished we could get on the cage and drop down to the 500 or some such level. It's strange how one misses the things that formerly were everyday occurrences. Without doubt our appreciation of small things will be increased tenfold by the time this game is over and truly for the good of us all.

I note with regret the death of your brother's son Forbes, Jr., and hope you will convey to his father my

sincere sympathy. Our country can well be proud of such splendid men as that.

I have seen our boys advance without a waver upon solid cement 'pill-boxes' and go into battle as unconcerned as men going to their daily tasks. Such spirit as that is bound to win and the peace-talk of the Kaiser and his tribe will have no effect on their attitude. Our usual daily noon-time hate has started. Fritz is throwing a few of his big ones in, but with little effect.

I hope you'll forgive me for having taken so much of your time, one gets lonely up here and feels the need of talking to someone in his own language, although as I look back, I've said very little about mining. At times it seems strange to be here, especially when I recall that day more than four years ago when I called on you in your London office just before this world calamity started. And here I am in it!

Yesterday I saw seven Hun planes brought down in their unsuccessful attempts to burn some of our balloons. One thing is certain: while life lasts it is full of thrills. I often wonder if when it's over and we go underground again there won't be a tendency, when some one is about to shoot a round, to just flatten up against the side of the drift and let her go by. That may be the result of some of the close calls one has when a shell explodes rather close.

Let me assure you in closing, that I look forward to each PRESS and hope that some day I'll be able to talk again in terms of the good old days. With my kindest regards.

E. G. SNEDAKER,
1st Lt. Eng. U. S. A.

The Gold Problem

The Editor:

Sir—In the article entitled 'Review of the Gold Problem' in your issue of October 26, H. N. Lawrie says "That it should cost more to produce an ounce of gold as a commodity than the monetary price of $20.6718 per ounce, is an economic eccentricity: yet, when it is realized that *this price was arbitrarily established by England in* 1812 without regard to the cost of production, it does not seem so unreasonable, with the present inflation of commodity prices, that this condition should exist. In fact the price of 85 shillings per ounce for gold, paid by England, in 1812 was above the market price at that time." The italics are mine.

In 1812, silver was the standard of value in the United States and the silver 'dollar' was the unit of value. The gold coins consisted of the eagle, half-eagle, and quarter-eagle, having the face-falue of ten dollars, five dollars, and two and a half, respectively. The eagle weighed 270 grains (the half and quarter-eagle in proportion) and was eleven-twelfths fine. The eagle therefore contained 247.5 grains of fine or pure gold, and a 'dollar', or one-tenth of that weight, would be 24.75 gr. At 24.75 gr. to the 'dollar' a Troy ounce of gold would be 19.39 'dollars' (480 ÷ 24.75) instead of $20.6718, as stated by Mr. Lawrie.

Owing to the fluctuations in the commercial ratio between gold and silver, the gold in the gold coins had become worth more as bullion than it was as money, and from 1805 to 1834 our gold coins were exported. In 1813, the gold in an eagle (247.5 grains) was exchangeable, commercially, for 4009.5 grains of silver ($10.80), a ratio of 16.2:1, whereas the coinage ratio was 15:1.

In June 1834, an attempt was made by the Congress to restore gold as currency by passing an act reducing the weight of the eagle to 258 grains, of which 232 grains were pure gold, equal to a fineness of 889 225/1000. On January 18, 1837, the Congress passed a law making 900/1000 the fineness for both gold and silver coins. This act reduced the amount of pure gold in the eagle to 232.2 gr. (nine-tenths of 258 gr.), which is at the rate of 23.22 gr. for one 'dollar', but the gold 'dollar' did not actually come into existence as an individual coin till 1849.

From 1812 to 1837 is 25 years, therefore the "monetary price" of $20.6718 for an ounce of gold was not made until a quarter of a century after the date named by Mr. Lawrie: also such "monetary price" was established by the Congress of the United States without the least particle of aid from England.

Again, Mr. Lawrie says "That it should cost more to produce an ounce of gold as a commodity than the monetary price of $20.6718 per ounce is an economic eccentricity."

Although it may cost, at a certain low-grade gold mine, considerably more in labor, power, powder, steel, etc., than the monetary equivalent of 480 gr. of gold to produce an ounce of gold, one fails to descern what that has to do with the undeniable fact that 480 grains divided by 23.22 grains gives a quotient of 20.67183+. The latter is a very simple mathematical problem and in no sense can it be considered an oddity in political economy: it has nothing whatever to do with the cost of producing an ounce or any other quantity of gold; nor does the fact that, in 1812, England decreed arbitrarily that, in coining gold, it would divide 20 lb. Troy weight into 934½ parts or pieces and call each one a 'sovereign' or 'pound sterling' have anything to do with the fact that the United States decreed arbitrarily, in 1837, that it would divide an ounce of gold into 20.67183+ parts and call each one a 'dollar'.

Furthermore, the quotient obtained by dividing a Troy ounce (480 gr.) by 113.+ (the number of grains of gold in a sovereign) is 4.247+, which means, simply, 4.247+ sovereigns together contain a Troy ounce of gold. 4.247+ sovereigns multiplied by 20, the number of shillings in one sovereign, gives a product of 84.95 shillings; but this means, simply, that 84.95 shillings, in gold, weigh 480 grains; but that has nothing whatever to do with the worth, exchange-value, or purchasing power of a Troy ounce of gold.

W. DE L. BENEDICT.

New York, November 2.

CONCRETE having a temperature of 55°F. is warm enough for complete setting in freezing weather.

SAN FELIX, ON THE ORINOCO

THE ORINOCO RIVER AT SAN FELIX

The Gold District of Venezuela

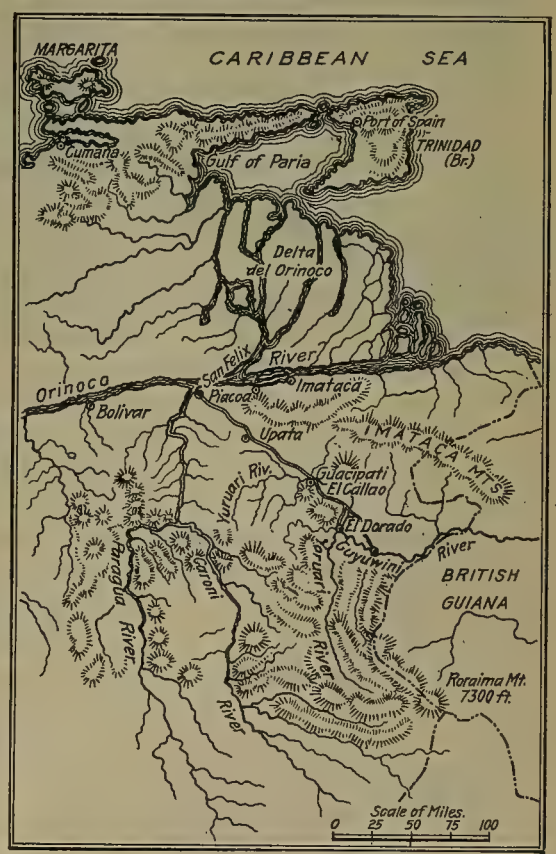
By H. HUNTINGTON MILLER

The principal gold-bearing area of Venezuela occupies the south-western portion of the Republic, extending from the headwaters of the river Yuruari down to the frontier of British Guiana. The river Caroni, one of the chief tributaries of the Orinoco system, bounds the district on the west, but this region has as yet been but little explored.

The portion of Venezuela embraced within these limits, and now known as Spanish Guiana, was once thought by the English to be the real El Dorado of the Spanish padres. Sir Walter Raleigh, in one of his western voyages in search of the elusive El Dorado, headed an expedition to the Orinoco in 1595 and explored the river in small boats as far as Ciudad Bolivar, or Angostura. He collected samples of gold and diamonds, brought to him by the Indians, but failed to find the source of either.

This part of Venezuela is of large extent, almost one-third the entire area of the country, without including the vast stretches of unexplored territory to the south and west, and from it Venezuela derives a considerable proportion of her revenue, in the shape of taxes on gold, rubber, chicle, and dye-woods, as well as from cattle and other minor industries. The country also contains vast stores of valuable hard-woods, but this source of wealth has small value at present, owing to the high cost of transportation.

The interior is best reached by means of the Orinoco river, which is navigable during most of the year for ocean-going steamers as far as Ciudad Bolivar. The nearest part of the gold district lies 150 miles south-east from the little port of San Feliz on the Orinoco, whence a wagon-road of fair quality connects with the mining town of El Callao and extends to the lower part of the district, 50 to 100 miles south-east. Some traffic is also maintained with the lower country by means of large flat boats and launches which come up from British Guiana; but as the Venezuelan government exacts high duties on all classes of merchandise and supplies coming into the



MAP OF VENEZUELA

country, as well as on all gold, rubber, etc., exported, the overland route, from San Feliz on the Orinoco to El Callao, is the more important.

The distribution of gold is general throughout this extensive area and its occurrence can be divided into three types: true alluvials, belts or zones of shale, and quartz veins.

The alluvial deposits are mainly confined to the extreme south-eastern portion, close to the border of British Guiana, the same formation extending across the frontier into that country.

Some placer gold is also found along the Caroní and especially one of its branches, the Paraguá; and the smaller tributary streams of the Orinoco just above Angostura are reported to afford gold, although these parts are as yet little explored.

The extensive belts and zones of auriferous shale and schist are probably the original source of the alluvial gold, which is derived from an intricate system of quartz veinlets, frequently uniting to form pockets of considerable richness. A study of the rock formation indicates that the gold was contained within stringers and crystalline grains of arsenical pyrite. The oxidation and decomposition of this mineral and of the friable schist that encloses it, has resulted in the formation of the dry pockets for which some portions of the district are famous. The gradual weathering of the schist and the washing out and concentration of the gold in the beds and banks of the streams have originated the placers of the lower country.

The gold-bearing quartz veins so far discovered are mainly confined to the more northerly portion of the district around the old town and mine of El Callao, which, during the period of its maximum production, ranked among the notable mining ventures of the world and is reputed to have produced $50,000,000 in the thirty-odd years of its life.

The veins occur near, or enclosed within, a series of eruptive dikes, mainly of diabase, which have fractured the schist. During the period of its maximum activity, thirty years ago, the El Callao district had a number of operating mines and several mills were running, with a total capacity of 1000 tons per day. The richer deposits, however, were soon worked out, and with increasing depth the veins became poor and refractory. Steam being the motive power and the neighboring forests being rapidly devastated, scarcity of fuel and increased cost of pumping, together with the impoverishment of the veins, caused the stoppage of one mine after another until only three companies are now in active operation, while a fourth, the successor of the original El Callao, has suspended operations pending the conclusion of the War.

The three companies still operating are the following:

Gold Fields of Venezuela, Ltd. This is an English corporation, with headquarters at El Peru, owning a large group of mining claims about four miles west of El Callao. The ore, after being crushed, is ground in two Chilean mills with addition of quicksilver. The discharged pulp is passed over amalgamation plates and the tailing from the plates is treated in steel tanks by cyanidation. The ore yields from ½ to ¾ oz. gold per ton.

El Amparo Mine, Ltd. This is also an English corporation owning the majority of stock in another company of similar name incorporated in Venezuela to work the once famous La Paz bonanza, one of the surface pockets, from which 10,000 oz. of gold was taken by crude methods, from a series of rich veinlets and pockets, almost at the surface. After the richest part of the bonanza had been worked out, a narrow but rich paystreak was exploited by the present company to a depth of over 300 ft., where it finally became too narrow and irregular for profitable working. Ore is crushed in a 10-stamp mill through 10-mesh screens. The resulting coarse pulp is then re-ground and the gold amalgamated in revolving Cobb pans. The tailing from the pans passes over James tables to remove the auriferous sulphides, and is then cyanided in steel tanks. The company is now in search of another property, so the mine is probably worked out.

Compania Anonima Minera Lo Increible. This is a Venezuelan corporation, with headquarters at Carácas. The mines, eight miles north-east from El Callao, are the result of a comparatively recent discovery. The hard quartz ore is crushed in a 20-stamp mill through 20-mesh diagonal-slot screens, the free gold being extracted by amalgamation. The average extraction from over 40,000 tons crushed to date is slightly in excess of ½ oz. per ton, about ¼ oz. remaining in the tailing. About 25,000 tons of tailing is now ready for cyanidation and the company is preparing to erect a plant to treat this residue as well as to handle the new tailing. Several veins are in process of exploitation and the future of the property is good.

New Callao Mining Co. This is the successor of the original El Callao, which was an English corporation. The present company, being a French organization, has been in trouble since the beginning of the War, as the necessary capital has been impossible to obtain. The main El Callao mine was abandoned and allowed to fill with water many years ago, but the property of this company is an extensive one, and embraces a number of other mines, some of them with excellent prospects.

The Cicapra district, which is situated about 25 miles north-west from El Callao, made a sensation some ten or fifteen years ago on account of the discovery of a succession of rich surface pockets of coarse gold, found almost under the grass-roots in the low hills bordering the banks of the Cicapra river, a branch of the upper Yuruári. The gold is in decomposed schist. A portion of this zone, including the bed and banks of the Cicapra river, is being explored by the Yuruári company, a Venezuelan corporation, with headquarters at Carácas. The operations, which as yet are of a preliminary character, are being carried on by means of a small clamshell dredge, with a capacity of 200 cu. yd. per day. The entire property of several hundred acres has been fairly well prospected by churn-drilling and several

million cubic yards of material is estimated to be available, with an average yield of $1 per yard, at a cost of 50c. per yard.

The Cuyuni and El Dorado districts of Spanish Guiana embrace the extreme south-eastern part of Venezuela, extending to the frontier of British Guiana. The

LO INCREIBLE 20-STAMP MILL

INTERIOR OF MILL

production is mainly from alluvial washings, although some gold is now being won from quartz veins.

The workings extend into the basin of the Cuyuni, which in turn runs into the main Esequibo river, the principal stream of British Guiana. Two French companies are operating in the district; they are known locally as the Cuyuni Company and the Perseverancia or El Dorado Company. In addition to these two ventures, a considerable quantity of gold, amounting in favorable seasons to several thousand ounces, is produced by primitive hand-washing in bateas and hand-rockers, from concessions belonging to private individuals, who grant permits to the miners, and exact a percentage of the gold produced as royalty. Altogether, this is a rich and promising district and may become of much greater importance when more favorable conditions prevail. At present the output is limited owing to lack of transportation, high cost of food and supplies, and the prevalence of malarial fevers. Beri-beri is also

ANOTHER VIEW OF THE INTERIOR

common, owing to the lack of vitamens in the food, which is chiefly milled rice.

With better facilities in the shape of dredges and other modern gold-saving machinery, as well as the construction of better roads from the Orinoco river, south-eastern Venezuela may easily take its place in the front rank as one of the most productive gold-mining districts of South America. This applies in equal proportion to the northern part, around El Callao. The entire district, with the exception of the immediate vicinity of El Callao, is fairly well timbered. The rivers and larger streams abound in water-power sites, and the country presents no unusual difficulties to the construction of good roads. The climate, while hot and damp in the rainy season, it not unhealthy for white men who observe the usual precautions necessary in all tropical countries.

Sampling and Analysis of Chromite

By ABBOT A. HANKS

Preparation of Samples. The sample sent to the assayer, if it represents either a shipment or a lot of ore extracted for shipment, should be taken so as to represent what it is intended to sample. It should weigh 40 to 60 lb., and contain no single piece larger than an egg. When this sample reaches the laboratory it should all be crushed through a rock-breaker, set to give a one-half inch product. The rock-breaker product should be thoroughly mixed and cut down with a riffle, a Jones divider, or similar sampler, to one-quarter of its original size. This quarter (10 to 12 lb.) should be put through laboratory rolls, set to give a product of 12 to 16-mesh. This roll-product should again be cut down to a sample of about one pound. The whole of this one-pound sample should be pulverized in a disc-grinder or similar machine to pass 100 or 150-mesh. Before making the analysis the pulp should be dried at 212°F. to constant weight.

Chromium

The analysis of chrome ore may be separated into the following operations:

Fusion in an iron crucible with sodium peroxide.

Dissolving the melt in water; filtering and making acid with sulphuric acid.

Adding an excess of ferrous ammonium sulphate and titrating with standard potassium permanganate solution.

The standard method is described in the following text-books:

'Technical Methods of Ore Analysis,' by A. H. Low.

'Standard Methods of Chemical Analysis,' by W. W. Scott.

'Principles of Quantitative Anelysis,' by W. C. Blasdale.

Weigh out ½ gram of 100 to 150-mesh product; place in a 20-cc. iron crucible; add 8 gm. sodium peroxide and mix thoroughly with a small glass rod; cover and slowly fuse over a Bunsen burner by slowly rotating over the flame for about five minutes; when complete, decomposition of the ore will result. When partly cool, transfer the crucible and the melt to a 400-cc. beaker containing 150 cc. to 200 cc. water. When action ceases, rinse the crucible and the cover, then boil the solution at least five minutes, then dilute to 350 cc. with hot water. When partly cool, filter on a Buchner funnel using suction and wash thoroughly with hot water. Dissolve the precipitate with dilute hydrochloric acid to determine if the fusion was complete. If not, start a new portion. Cool the filtrate, transfer to a 1000-cc. beaker and dilute to 500 cc. with cold water, and add 25 cc. sulphuric acid (2 to 1); add 50 cc. standard ferrous ammonium sulphate solution (which should be an excess), from an automatic pipette, to the solution in the beaker and then titrate with standard potassium permanganate solution. Standardization is accomplished by weighing ½ gm. of c.p. potassium chromate into a 1000-cc. beaker, dissolve in cold water, and make acid as above and proceed as explained; 50 cc. of the ferrous ammonium sulphate solution is titrated at least once each day by the potassium permanganate to determine their relative strength.

Potassium chromate equals 39.135% Cr_2O_3.

Ferrous ammonium sulphate solution contains 100 gm. ferrous ammonium sulphate crystals and 20 cc. sulphuric acid per litre.

Potassium permanganate solution contains 6.0 gm. c.p. $KMnO_4$ per litre.

Example:

50 cc. of ferrous ammonium sulphate solution equals 69.45 cc. $KMnO_4$.
One-half gram c. p. potassium chromate equals 26.25 cc. $KMnO_4$.

Then	69.45
	26.25
	43.20
	2
	86.40 cc.

$\frac{0.39135}{86.4} = 0.0045296$ gm. Cr_2O_3 = value of 1 cc. of $KMnO_4$.

Silica

One-half gram of ore is fused as above but with c. p. Na_2O_2; dissolve in 50 cc. water; rinse off the crucible and the cover; make acid with hydrochloric acid; and take to dryness twice as for silica determinations. Complete as usual for silica. Run a blank using the same amount of c. p. Na_2O_2 under the above conditions, and deduct any SiO_2 thus obtained from the SiO_2 found in the ore.

The Determination of Chromium in Chromite

The following rapid method is in use at the Berkeley Experiment Station of the U. S. Bureau of Mines:

The ore should be ground to 100-mesh. Weigh out 0.5 gm. sample and brush into a 20-cc. spun-iron crucible in which has previously been placed 4 to 5 gm. of fresh Na_2O_2 (technical grade is satisfactory). Mix well with a glass rod, cover with a little Na_2O_2, and fuse at a low-red heat. After the charge has melted it should remain in the molten condition for five minutes. Allow the crucible to cool, place in a 600-cc. beaker of pyrex or other low-expansion glass or in a large casserole; add water and digest until the fused mass has disintegrated, after which remove and rinse the crucible. Boil for 10 minutes to decompose the Na_2O_2. Without filtering,

neutralize the solution with 1–4 H_2SO_4 or 1–1 HCl and add 25 to 30 cc. excess. Dilute to approximately 400 cc., cool and titrate with a standard solution (about 0.2 N) of $FeSO_4$. Add a slight excess of $FeSO_4$ solution, as shown by spot-plate tests with a 1% solution of $K_3Fe(CN)_6$, and finish the determination by back-titration with standard $K_2Cr_2O_7$ solution. The $FeSO_4$ solution may be added rapidly without great care, as the approximate end-point is readily recognized by the color-change of the solution. With a little practice two or three spot-tests should be sufficient to determine the exact end-point.

Notes: The quickness of this method is due largely to the omission of filtration before acidifying the dissolved fusion. Manganese is practically the only interfering substance found in Western ores, and when this is present filtration is necessary.

The initial alkaline solution containing the precipitate inclines to bump on boiling. A few chips of fresh unglazed porcelain or a stirring-rod with roughened end, placed opposite one of the points where the beaker makes contact with the hot plate, minimizes this difficulty.

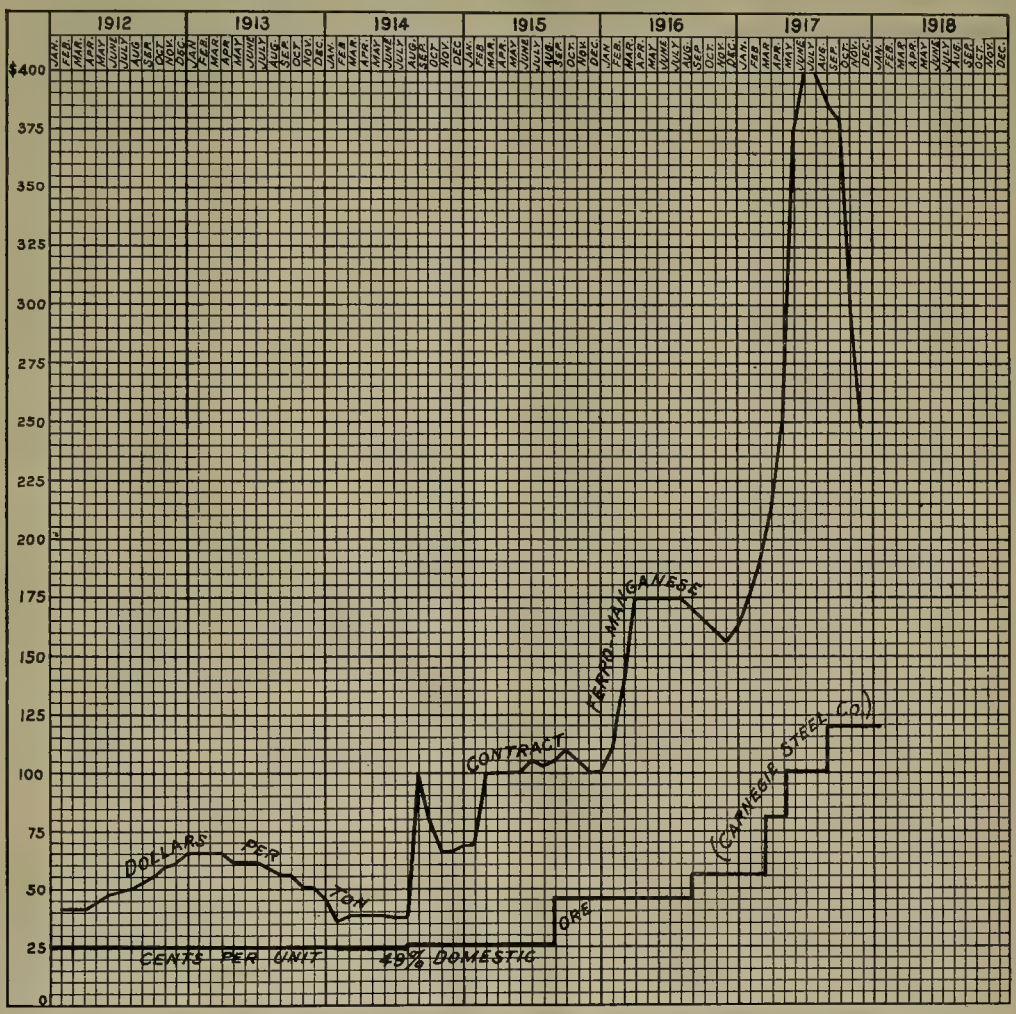
The standard $FeSO_4$ solution is prepared by dissolving 56 to 60 gm. $FeSO_4 \cdot 7H_2O$ in about 800 cc. distilled H_2O, to which has been added 100 cc. concentrated H_2SO_4. After cooling, the solution is diluted to one litre. The 0.2 N $K_2Cr_2O_7$ solution may be made by dissolving 9.806 gm. c.p. $K_2Cr_2O_7$ in one litre. The $FeSO_4$ solution may be standardized with a standard $KMnO_4$ solution based on Bureau of Standards sodium oxalate or against the $K_2Cr_2O_7$ solution, provided this was made from a salt of known purity.

One cubic centimetre of 0.1 N solution is equivalent to 0.001733 gm. Cr, or 0.002532 gm. Cr_2O_3.

Manganese and Pyrite

[We quote herewith part of the supplementary testimony given by Philip N. Moore before the Committee on Mines and Mining of the U. S. Senate, because it lays emphasis on a point that should not be overlooked at this time.—EDITOR.]

The element of time in the matter of supply and demand under these war conditions is of such weight that the usual results of supply and demand fail to follow. The minerals mostly affected by this bill, namely, pyrite and manganese, exist in the United States in relatively small bodies, mostly owned by individuals, and not corporately controlled in units, and under normal conditions



PRE-WAR AND WAR PRICES FOR MANGANESE ORE AND FERRO-MANGANESE

unable to operate, partly due to the much larger and cheaper supply obtainable from abroad, and partly due to the fact that manufacturing industry is controlled while the producing is not. In my testimony before the House committee upon this bill, I alluded to one instance of the difference in price between the manganese alloys and manganese ores, a chart for which had been worked out by Mr. Hewitt of the U. S. Geological Survey. This chart shows what is the normal condition of affairs in the manganese ore industries in pre-war times; it covers the market-price from 1912 to the present time. Due to the fact that there was only one large manufacturer of manganese alloys in the United States, the price per unit for manganese or domestic ore has been kept practically at one stable level for four years, while the price of the alloy varied greatly with, at times, an excessive spread between the ore and the alloy. That spread varies excessively, and in the last two years has been very great, allowing an excessive profit on the manufacture. That can be controlled. The spread will doubtless now, under the inhibition of foreign imports, diminish, but it is a condition which under the highly controlled manufacturing system can only be affected by the hand of governmental power. Supply and demand will affect it for a time, but there again the element of time comes in, and you may see a sudden spurt, a high price for manganese ore, which will possibly be so high that the margin of profit will be slight, but in the end, as long as the manufacture is controlled, and there is no governmental control of price, that unstable and unfair condition will obtain.

With respect to pyrite, there are concrete instances, which I shall be glad to have go on the record, why development would proceed if the consumer of pyrite ore, and the manufacturer of acid, were not able to control the market himself and refuse a fair price, or, which is just as bad, refuse a time contract. At the present time certain parties are estimating and figuring seriously on the construction of a plant in our Western coalfields to produce pyrite ore by concentrating the pyrite waste from the coal mine, which is very large. There are thousands of tons of pyrite going to waste in our Illinois, Indiana, and Kentucky coalfields today, absolutely unsaved, a large portion of which might be utilized at a guaranteed price. The gentlemen who are planning this work know what they can do in the treatment and know what their cost will be, and know approximately what they can get the raw material for; but the acid-burners, so far, have been unwilling to give them any time contracts at satisfactory figures. The acid-burner has been accustomed to deal with many small pyrite producers or to use sulphur from our Texas and Louisiana fields, and he has had a certain domination over the small pyrite producer, such as a manufacturer always has. In my judgment, nothing except Government control can handle that situation and stimulate the production to the degree which is needed. We are up against an impending shortage of pyrite, which is going to require either long-haul supply from the Rocky Mountains, which in turn will consume rolling-stock and time and money, or some time guaranty which will bring the stuff out from the East. Supply and demand is a mighty good horse on a long race, but when he meets the impediments of war and danger he is apt to be outclassed by emergency.

Oil in San Francisco

About the first of October, the California State Board of Harbor Commissioners began an excavation for a reinforced concrete oil-storage tank on a lot at the corner of Battery street and the Embarcadero, San Francisco. As this is filled land, and only about 200 feet west of the San Francisco sea-wall, it is usual to strike water at a depth of about six feet. Accordingly when the excavation neared this depth, a small centrifugal pump was installed to take care of the water. After the pump had been in operation for a few hours, the foreman of the job was much surprised to find that the pump was delivering a stream of almost straight oil, and a great deal of excitement was created along the water-front. Reports went broadcast that the State Board of Harbor Commissioners had brought in an oil-well almost in the heart of San Francisco. About the same time, some workmen engaged on work for the State in excavating for concrete piles, about four blocks north, also struck a small amount of oil. This increased the excitement and repeated inquiries came to the office of the U. S. Bureau of Mines in the Custom House for an explanation of the occurrence of oil in paying quantities in San Francisco. The matter has been investigated by one of the members of the Bureau, and it has been found that all the claims made for the discovery of oil at the corner of Battery and the Embarcadero in paying quantities are true. For the first four days after the oil was discovered, it was being pumped from the excavation at the rate of about 120 bbl. per day and since that time approximately 1500 bbl. of oil has been recovered. The oil has a gravity of 18° B., and is now being used in the locomotives of the State Belt Line.

Investigation has shown that at the time of the fire and earthquake in 1906, there were several large oil-storage tanks about five blocks north of the point where the excavation was made. These tanks were all on filled ground. At least one of them, which is said to have had a capacity of 37,000 bbl., was ruptured at the time of the earthquake by the ground settling under it, and a large amount of the contents presumably seeped in the porous fill, which was composed largely of brickbats, rubbish, rock, etc., before the fire reached this point, about two days later. Undoubtedly, this is the oil that is now being recovered.

The instance is worthy of note in that it tends to show in a measure the action of water on oil in underground strata. The sea-wall running along the easterly line of the Embarcadero has kept the oil from getting out into the Bay. The solid formation of Russian hill to the west has kept it from going down, so its migrations are limited to a comparatively narrow north and south strip in the vicinity of the Embarcadero.

THE S. A. T. C. AT COLUMBIA UNIVERSITY SUBSCRIBING TO LIBERTY BONDS

Columbia University in War-Time

Herewith we publish a photograph that will gladden the hearts of Columbian graduates and interest others. It shows the response of the 3000 members of the Student's Army Training Corps when asked to subscribe to Liberty bonds. The order came, "All men who will subscribe to a Liberty bond hold up your hands!" The response is shown. They subscribed $200,000 on the spot.

THE WAR TRADE BOARD has introduced restrictions on the importation of tin in order to give effect to the regulation of the distribution of tin and tin ores, concentrates, and derivatives under the Tin Executive recently established in London. All outstanding licenses for the importation of pig tin, tin ore, and tin concentrates, and, or, any chemical extracted therefrom, have been revoked as to ocean shipment from abroad after October 20, 1918. Hereafter no licenses will be issued for the importation of these commodities except to cover shipments consigned to the United Steel Products Company.

THE ELECTRIC-POWER LOAD in an oilfield is considered to be an ideal one for a central station; that is, the power-factor is high. The load is practically constant 24 hours per day, for every day.

BETTER ILLUMINATION is necessary for all-night work than where the artificial lighting is used for only an hour or two per day.

Production of Gold and Silver in the United States During 1917

The Bureau of the Mint and the U. S. Geological Survey have issued the following joint final statement of the production of gold and silver in the United States during the calendar year 1917:

	Gold		Silver	
State or Territory	Ounces	Value	Ounces	Value
Alaska	709,729	$14,671,400	1,207,164	$994,100
Alabama	106	2,200	.....	.....
Arizona	250,613	5,180,600	6,962,257	5,733,400
California	1,012,461	20,929,400	2,107,107	1,735,200
Colorado	772,766	15,974,500	7,291,495	6,004,500
Georgia	314	6,500	.....	.....
Idaho	36,511	754,800	11,402,542	9,390,000
Illinois	.....	.....	7,116	5,900
Maryland	.....	.....	538	400
Michigan	.....	.....	684,225	563,400
Missouri	15	300	63,344	52,200
Montana	177,690	3,673,200	14,555,034	11,986,100
Nevada	335,361	6,932,500	11,217,654	9,237,700
New Mexico	52,505	1,085,400	1,535,807	1,264,700
North Carolina	524	10,800	590	500
Oregon	81,624	1,687,300	172,152	141,800
Philippine Islands	69,953	1,446,100	12,715	10,500
Porto Rico	5	100	.....	.....
South Carolina	82	1,700	.....	.....
South Dakota	356,662	7,372,900	190,382	156,800
Tennessee	267	5,500	106,975	88,100
Texas	5	100	587,945	484,200
Utah	170,383	3,522,100	13,360,905	11,002,700
Vermont	5	100	403	300
Virginia	63	1,300	4,500	3,700
Washington	23,617	488,200	266,112	219,100
Wyoming	179	3,700	3,400	2,800
Total	4,051,440	$83,750,700	71,740,362	$59,078,100

Compared with the production in 1916—gold $92,590,300, and silver 74,414,802 fine ounces—these figures indicate a reduction in the output of gold of $8,839,600 and in the output of silver of 2,674,440 fine ounces.

Copper Distribution in Mexico

The accompanying map of Mexico indicates by heavy dots the situation of the copper mines of the Republic that have been developed beyond the prospect stage. It was prepared by Luis C. Espinosa, as consulting engineer and chairman of the Technical Commission charged by the Carrancista government with the duty of making a report upon the iron and copper resources of Mexico, and was published as a large map accompanying the 'Boletin Minero' for May-June 1918. A list of the mines was also given, classified by States. No technical information, however, was included. The following table of production, by States, for 1917, will be of interest in connection with the map.

For comparison it may be pointed out that this is a trifle less than the production of copper in the United States in 1890, and 11.2% of the output last year, which amounted to 1,886,000,000 lb. The grouping of the deposits is interesting. There are eight areas. The Baja Californian and Sonoran extend in long zones bearing slightly east of south. Each of the others represents a grouping about a common centre. The deposits in the north-western areas generally carry but small quantities of gold and silver.

MAP OF MEXICO, SHOWING DISTRIBUTION OF COPPER DEPOSITS

Mexican Copper Production in 1917

State	Pounds
Aguascalientes	9,616,854
Baja California	20,295,000
Coahuila	1,416,800
Nuevo Leon	183,365,000
Sonora	68,396,865
San Luis Potosí	1,244,298
Zacatecas	26,918,309
Total	211,253,126

Calculating Traverses Without Tables

By A. J. SALE

In problems involving calculations, the most prevalent cause of failure is mathematical cowardice, which means giving up before a thorough attempt has been made. I believe that, in the primary teaching of any subject, the instructor achieves better results by concentrating his energy upon the encouragement of self-confidence in the pupil than by devoting too much time to the subject itself. It is surprising how rapidly the average person can grasp the principles of any science, if properly trained to self-confidence. I have taught many men, with only a grade-school education, to use the slide-rule, logarithmic tables, simple algebra, and even primary calculus, and invariably the principal difficulty lay in convincing them that they could easily learn what was being explained to them. Personally, I would like to see the metric system taught in the kindergarten, algebra in the third grade, and calculus in the seventh, but, within the last 20 years, the tendency has been to decrease rather than increase the mathematical training. The result is that, in the most serious crisis which the nation has ever faced, and one in which mathematics are the essence of success, we find the average American with but little training along these lines. How many of us can instantly grasp the meaning of 20 kilometres? To some it will not convey any idea; others will say it is about 10 miles, while a few can figure (20 by 1000) by 39.37 = 787,400 in., or 65,617 ft. = 12.4 miles. But this figuring takes time, and then does not give the information which thinking in the metric system would accomplish.

In the following descriptions, in order to make the work complete, I touch briefly upon many branches of mathematics; but I believe that this article will be perfectly clear to the average engineer, provided he has sufficient bravery not to be frightened at the methods involved. While writing this paper, I am in an isolated camp without any reference-books or tables whatsoever, so I may appear to enter into more detail than is necessary; but, as the purpose is to explain how any kind of surveying problem can be solved without the use of tabulated information, it requires some unusual detail. If any other engineer will lock himself in a room with nothing but pencil and paper, and attempt to figure the closing line of a traverse, I venture that he will have to resort to considerable preliminary calculation.

I will not take time by explaining the derivation of the formulas $\text{Sin}\ (U+V) = \text{Sin}\ U \times \text{Cos}\ V + \text{Cos}\ U \times \text{Sin}\ V$ or $\text{Cos}\ (U+V) = \text{Cos}\ U \times \text{Cos}\ V + \text{Sin}\ U \times \text{Sin}\ V$; but Fig. 1, representing a circle of unit radius, is all that is necessary to derive them. Also Fig. 2 is used in like manner to derive the formulas $\text{Sin}\ (U-V) = \text{Sin}\ U \times \text{Cos}\ V - \text{Cos}\ U \times \text{Sin}\ V$; and $\text{Cos}\ (U-V) = \text{Cos}\ U \times \text{Cos}\ V + \text{Sin}\ U \times \text{Sin}\ V$. If the reader will take these sketches and personally work out these derivations without looking in a handbook for an explanation, he will find that they will be strongly impresesd upon his memory after so doing.

Having derived the above formulas, it is an easy matter to obtain: $\text{Sin}\ (2U) = 2\ \text{Sin}\ U \times \text{Cos}\ U$, and $\text{Cos}\ (2U) = \text{Cos}^2\ U - \text{Sin}^2\ U = 1 - 2\ \text{Sin}^2\ U$, from which $\text{Cos}\ U = 1 - 2\ \text{Sin}^2\ (U/2)$.

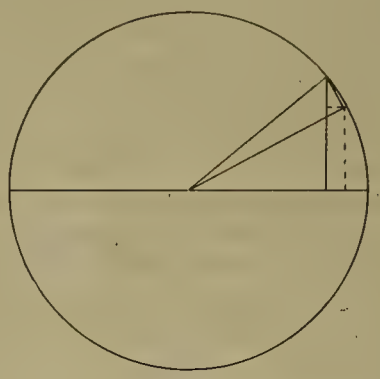


Fig. 1

The above are the most essential formulas for the work that I am about to describe, but sometimes it will save time to use: $\text{Sin}\ (3U) = \text{Sin}\ (2U+U)$, which can be reduced to $3\ \text{Sin}\ U - 4\ \text{Sin}^3\ U$; and $\text{Cos}\ (3U) = \text{Cos}\ (2U+U)$, which can be reduced to $4\ \text{Cos}^3\ U - 3\ \text{Cos}\ U$.

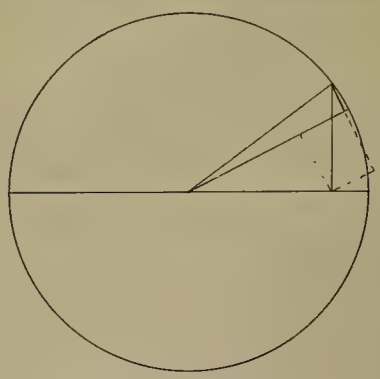

Fig 2

For work of this kind, after deriving the primary trigonometric formulas, it will be necessary to review a

few points in higher algebra. One of these is the binomial theorem:

$$(X+Y)^n = X^n + N\cdot X^{(n-1)} \times Y + \frac{N(N-1)}{1\times 2} \times X^{(N-2)}\cdot Y^2 + \ldots.$$

This can easily be worked by starting with $(X+Y)^2$, $(X+Y)^3$, etc., until the mind grasps the entire series. The principal use for this formula is in the study of errors in such a function as

$$\sqrt{1+A} = (1+A)^{\frac{1}{2}} = 1 + \tfrac{1}{2}A - \tfrac{1}{8}A^2 + \tfrac{1}{16}A^3 \ldots.$$

If A is very small, it can be discarded beyond the first power, for reasonably accurate work; while, for greater accuracy, $\sqrt{1+A}$ can be taken as $1 + \frac{1}{2}A - \frac{1}{8}A^2$.

For instance, $\sqrt{1.21} = \left(1 + \frac{21}{100}\right)^{\frac{1}{2}}$ gives 1.09949 instead of 1.10.

It is also sometimes convenient to understand the solution of an equation of the form $AX^3 + BX^2 + CX + D = 0$.

The first operation is to divide by A, and obtain the form $X^3 + EX^2 + FX + G = 0$.

Next, let $X = Y - \frac{1}{3}E$, which gives the form $Y^3 + HY + I = 0$.

Now replace Y by two variables, P and Q. Since we are replacing by two variables, we require two governing conditions. Let these conditions be $Y = P + Q$, and $P^3 + Q^3 = -I$.

From which we have $Y^3 = (P+Q)^3 = P^3 + Q^3 + 3P^2Q + 3PQ^2 = (P^3 + Q^3) + 3PQ(P+Q)$.

$HY = H(P+Q) = H(P+Q)$.

$I = I = I$.

$Y^3 + HY + I = (P^3 + Q^3) + I + (P+Q)\ (3PQ + H)$.

But, $Y^3 + HY + I = 0$; and $(P^3 + Q^3)$ was taken $= -I$.

Therefore $(P+Q)\ (3PQ + H) = 0$.

Dividing by $(P+Q)$, $3PQ + H = 0$; or $PQ = -\frac{1}{3}H$.

Cubing this equation, $P^3Q^3 = -1/27H^3$.

And we have already taken $(P^3 + Q^3) = -I$.

Now let $P^3 = U$, and $Q^3 = V$.

Then $U + V = -I$; $UV = -1/27H^3$.

The above can be solved by quadratic equations for U and V; from which P and Q can be obtained; which will give us the value of Y; finally the value of X.

Even without the solution of the cubic equation we could proceed with the calculation of any traverse; but we would be in the dark as to probable errors, which forces us into calculus. I have seen engineers of high ability stand in horror at the mention of even differential calculus, but, in fact, this is a very simple branch of mathematics. All that is necessary in order to remember primary calculus is to bear in mind that the differential of any function is the effect caused by an infinitely small change. For instance, to obtain $d\,X^2$, let M represent an infinitely small amount. Then $(X+M)^2 = X^2 + 2XM + M^2$; and $(X+M)^2 - X^2 = +2XM + M^2$. But, since M was assumed to be infinitely small, all powers beyond the first can be discarded, leaving $2XM$. But $(X+M)^2 - X^2$ represents the change in the function X^2 due to the infinitely small change M, which we call $d,\ X$. Hence $d,\ X^2 = 2X(dX)$. In the same way it can be shown that for any power

$$d,\ X^n = N\cdot X^{(N-1)} \times (d,\ X)$$

The simple integral is the result of noting what function can be differentiated to give the function the integral of which is sought. For instance, it can be seen at a glance that $\int 2X \times (d,\ X)$ is X^2, but it must be borne in mind that, since the differential of a constant is zero, there must be a constant, K, added to the integral. That is for the above case $\int 2X\ (d,\ X) = X^2 + K$. The value of K must be determined from other data. By remembering the primary principle, any ordinary differential can be worked out. Take, d, Sin U; Sin $(U+M)$ = Sin U $\times$ Cos M + Cos $U \times$ Sin M. Since M is infinitely small, Cos $M = 1$ and Sin M can be taken as M, making Sin $(U+M)$ = Sin $U + M$ Cos U and Sin $(U+M)$ − Sin $U = M$ Cos U; or d, Sin $U = +$ Cos U $(d,\ U)$. In like manner it can be shown that d, Cos $U = -$ Sin U $(d,\ U)$. The second differentiation of a function is applied the same as the first, and so on. Take any function of X, which we will call

$$F(X) = A + BX + CX^2 + DX^3 + EX^4 + FX^5 + GX^6 + \ldots\ldots$$

By successive differentiation we obtain:

$d,\ F(X) = (B + 2CX + 3DX^2 + 4EX^3 + 5FX^4 + 6GX^5 + \ldots\ldots)d,\ X.$

$d_2,\ F(X) = (2\times 1C + 3\times 2DX + 4\times 3EX^2 + 5\times 4FX^3 + 6\times 5GX^4 + \ldots\ldots)d,\ X.$

$d_3,\ F(X) = (3\times 2\times 1D + 4\times 3\times 2EX + 5\times 4\times 3FX^2 + 6\times 5\times 4GX^3 + \ldots\ldots)d,\ X.$

$d_4,\ F(X) = (4\times 3\times 2\times 1E + 5\times 4\times 3\times 2FX + 6\times 5\times 4\times 3GX^2 + \ldots\ldots)d,\ X.$

$d_5,\ F(X) = (5\times 4\times 3\times 2\times 1F + 6\times 5\times 4\times 3\times 2GX + \ldots\ldots)d,\ X.$

$d_6,\ F(X) = (6\times 5\times 4\times 3\times 2\times 1G + \ldots\ldots)d,\ X;$ and so on.

Now if we make $X = 0$ in each of these functions we see that

$F(X_0) = Ad,\ X.$

$d,\ F(X_0) = Bd,\ X.$

$d_2,\ F(X_0) = 2\times 1\,C\,d,\ X.$

$d_3,\ F(X_0) = 3\times 2\times 1Dd,\ X.$

$d_4,\ F(X_0) = 4\times 3\times 2\times 1Ed,\ X.$

$d_5,\ F(X_0) = 5\times 4\times 3\times 2\times 1Fd,\ X.$

$d_6,\ F(X_0) = 6\times 5\times 4\times 3\times 2\times 1Gd,\ X,$ and so on.

From which,

$A = F(X)_0.$

$B = d,\ F(X)_0.$

$C = \frac{1}{2\times 1}\ d_2,\ F(X)_0.$

$D = \frac{1}{3\times 2\times 1}\ d_3, F(X)_0.$

$E = \frac{1}{4\times 3\times 2\times 1}\ d_4, F(X)_0.$

$F = \frac{1}{5\times 4\times 3\times 2\times 1}\ d_5, F(X)_0.$

$G = \frac{1}{6\times 5\times 4\times 3\times 2\times 1}\ d_6, F(X)_0,$ and so on.

Applying this law, to find the Sine function:

$\text{Sin } 0 = 0.$

$d,\ \text{Sin}_0 = \text{Cos}_0 = +1.$

$d_2,\ \text{Sin}_0 = d,\ \text{Cos}_0 = -\text{Sin}_0 = 0.$

$d_3,\ \text{Sin}_0 = d,\ (-\text{Sin})_0 = -\text{Cos}_0 = -1.$

$d_4,\ \text{Sin}_0 = d,\ (-\text{Cos})_0 = \text{Sin}_0 = 0.$

$d_5,\ \text{Sin}_0 = d,\ (\text{Sin})_0 = \text{Cos}_0 = +1,$ and so on.

From which we note

$A = 0$

$B = -1.$

$C = 0.$

$D = -1 \times \frac{1}{3 \times 2 \times 1}$

$E = 0.$

$F = +1 \times \frac{1}{5 \times 4 \times 3 \times 2 \times 1}$, and so on.

Which demonstrates that the Sine function is $\text{Sin } U = U - \frac{1}{3 \times 2 \times 1} U^3 + \frac{1}{5 \times 4 \times 3 \times 2 \times 1} U^5 - \ldots\ldots$

In like manner, it can be demonstrated that the Cosine function is, $\text{Cos } U = 1 - \frac{1}{2 \times 1} U^2 + \frac{1}{4 \times 3 \times 2 \times 1} U^4 - \frac{1}{6 \times 5 \times 4 \times 3 \times 2 \times 1} U^6 + \ldots\ldots$

These series will prove of great service, and they are worth remembering.

If we take the function $1 + X + \frac{1}{2 \times 1} X^2 + \frac{1}{3 \times 2 \times 1} X^3 + \frac{1}{4 \times 3 \times 2 \times 1} X^4 + \ldots\ldots$ and replace X by $\sqrt{-1} \times U$, called iU, we find $1 + iU - \frac{1}{2 \times 1} U^2 - \frac{1}{3 \times 2 \times 1} iU^3 + \frac{1}{4 \times 3 \times 2 \times 1} U^4 + \frac{1}{5 \times 4 \times 3 \times 2 \times 1} iU^5 - \ldots\ldots$

By segregating we obtain

$$\left(1 - \frac{1}{2 \times 1} U^2 + \frac{1}{4 \times 3 \times 2 \times 1} U^4 - \ldots\ldots\right) + i\left(U - \frac{1}{3 \times 2 \times 1} U^3 + \frac{1}{5 \times 4 \times 3 \times 2 \times 1} U^5 - \ldots\ldots\right)$$

which we can see is $\text{Cos } U + i \text{ Sin } U$. This is the best way to remember how to derive the Sine and Cosine series, as it is easy to remember the original series; and, since there is an i in Sin, it makes a natural combination.

Before leaving calculus, we will use it to give us the value of the ratio of the circumference of a circle to its diameter, usually expressed as 3.1416 or 3.14159, which, in the absence of all tabular data, might be forgotten. We have already shown how we get $d,\ \text{Sin } U = \text{Cos } U\ (d, U)$ and $d,\ \text{Cos } U = -\text{Sin } U\ (d, U)$. Next, let us consider $d,\ XY;\ (X + M)\ (Y + N) = XY + XN + YN + MN$, from which we can discard MN as the product of two infinitely small quantities, leaving $XN + YN$, or $d,\ XY = X\ (d, Y) + Y\ (d, X)$.

For $d,\ (\frac{1}{X});\ \frac{1}{(X + M)} = \frac{1}{X} - \frac{M}{X^2} + \frac{M^2}{X^3} - \frac{M^3}{X^4} + \ldots\ldots$

Discarding the higher powers of M, we find

$$\frac{1}{(X + M)} - \frac{1}{X} = -\frac{M}{X^2}.$$

Or, $d,\ (\frac{1}{X}) = -\frac{1}{X^2}\ (d, X)$

From which $d,\ (\frac{X}{Y}) = \frac{1}{Y}\ (d, X) - \frac{X}{Y^2}\ (d, Y).$

Therefore $d,\ \text{Tan } U = d,\ (\frac{\text{Sin } U}{\text{Cos } U}) = \frac{1}{\text{Cos } U}\ (d, \text{Sin } U) - \frac{\text{Sin } U}{\text{Cos}^2 U}\ (d, \text{Cos } U) = \frac{1}{\text{Cos } U} \times \text{Cos } U\ (d, U) - \frac{\text{Sin } U}{\text{Cos}^2 U}\ (-\text{Sin } U)\ (d, U) = (1 + \frac{\text{Sin}^2}{\text{Cos}^2 U})(d, U)\ \frac{1}{\text{Cos}^2 U}\ (d, U).$

Now take the function $Y = \text{Tan}^{-1} X$, meaning Y is an angle whose tangent is X; or $X = \text{Tan } Y$.

Differentiating both sides of the last equation, $d,\ X = d,\ \text{Tan } Y = \frac{1}{\text{Cos}^2 Y}\ (d, Y) = (1 + \text{Tan}^2 Y)\ (d, Y) = (1 + X^2)\ (d, Y).$

Or, $d,\ Y = \frac{1}{(1 + X^2)}\ (d, X) = (d, X)\ (1 - X^2 + X^4 - X + \ldots\ldots)$

Integrating both sides of this equation: $Y = X - 1/3X^3 + 1/5X^5 - 1/7X^7 + \ldots\ldots + K.$

But, since $Y = 0,\ X = 0,$ making $K = 0.$

Now consider the angle 45° or $\frac{\pi}{4}$, whose tangent is 1, (setting $X = 1$ in the above equation), $\frac{\pi}{4} = 1 - 1/3 + 1/5 - 1/7 + 1/9 - 1/11 + \ldots\ldots$

Or $\pi = 4(1 - 1/3 + 1/5 - 1/7 + 1/9 - 1/11 + \ldots\ldots)$

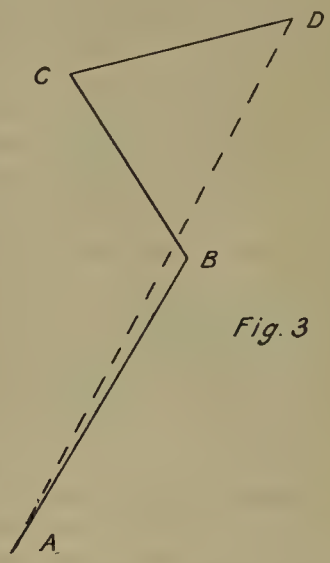

Fig. 3

Which can be reduced to $\pi = 8(1/3 + 1/35 + 1/99 + 1/195 + 1/325 + \ldots\ldots).$

Before completing the preliminary study it is advisable to grasp the theory of uniform accuracy. Anyone can understand that it would be foolishness to run part of a traverse with stadia, and another part with steel tape, using spring balances and thermometers, but I have seen engineers of considerable experience do practically the same thing in using traverse tables by stringing out their figures all the way across a sheet of paper, when the final ones could have been dropped at one or two places. In calculations involving distances and bearings, it stands to reason that, for uniform accuracy, it is only necessary to be 1/100 as accurate with a bearing controlling a 10-ft. distance as it would be with one controlling 1000 ft. The same rule applies to the multiplication of large fractions. Let $A + C$ represent a large decimal fraction, of which

A is the beginning and C the finishing portion. In the same way let $B + D$ represent another. By multiplying them together we find $(A + C)\ (B + D) = AB + AD + BC + CD$. Now, since the problem is the question of discarding both C and D, it is evident that CD will be too small to enter into the discussion, leaving $AB + AD + BC$. Now, if we had discarded both C and D at the start, the result would be AB, with a consequent error of $AD + BC$. If our allowable error is E, and E is greater than $AD + BC$, we can write $(A + C)\ (B + D) = AB$. As an example: Suppose we are working with an allowable error of 1 in the fourth decimal place, and we have to multiply 0.08123 by 0.05612, we can see at a glance that $0.00023 \times 0.056 + 0.00012 \times 0.081$ is under 0.0001, allowing us to write 0.081×0.056. In this new expression we see that 0.006×0.081 is more than 0.0001, but we also see that 0.001×0.056 is less than 0.0001. Which allows us to write $0.08 \times 0.56 = 0.00448$, which, to preserve uniform accuracy, we will call 0.0045. If we actually multply 0.05612×0.08123 we obtain 0.00455+, called 0.0046, within our limit of allowable error. The immense amount of labor saved by this method is very important. In work where great accuracy is required I usually assume my allowable error at 1/10 its actual amount, to cover the accumulation of minor errors. In this kind of work it is better to make multiplication from the left-hand side, so as to observe when the line of necessary accuracy has been crossed. It is also apparent that the rule of casting out 9s will prove of value in checking the arithmetic.

We are now prepared for basic calculations. The primary functions at the start are the Sine and Cosine of 45°, 60°, and 30°; also the Sine of 1 minute. In case one does not remember, an isosceles right-triangle with unit hypotenuse will demonstrate both Sin 45° and Cos 45° to be $\frac{1}{2}\sqrt{2} = 0.70711$. While a bisected equilateral triangle will show Sin $60° = \frac{1}{2}\sqrt{3} = 0.86603$; Cos $60° = \frac{1}{2}$; Sin $30° = \frac{1}{2}$; and Cos $30° = \frac{1}{2}\sqrt{3} = 0.86603$. For Sin 1′, we will assume that it is identical with the arc-value of 1′, in a circle of unit radius. This value is $\frac{2\pi}{360 \times 60} = \frac{6.28318}{21600} = 0.0002909$. If we apply this value in the function $\text{Sin } U = U - \frac{1}{3 \times 2 \times 1} U^3 + \frac{1}{5 \times 4 \times 3 \times 2 \times 1} U^5 - \ldots\ldots$, we see that, to take it as Sin 1′, will give us practically perfect results.

For 15°: Sin $15° = \text{Sin } (45° - 30°) = \text{Sin } 45° \times \text{Cos } 30° - \text{Cos } 45° \times \text{Sin } 30° = (\frac{1}{2}\sqrt{2})\ (\frac{1}{2}\sqrt{3}) - (\frac{1}{2}\sqrt{2})\ (\frac{1}{2}) = \frac{1}{4}\sqrt{6} - \frac{1}{4}\sqrt{2} = 0.25882$. Cos $15° = \text{Cos } (45° - 30°) = \text{Cos } 45° \times \text{Cos } 30° + \text{Sin } 45° \times \text{Sin } 30° = (\frac{1}{2}\sqrt{2})\ (\frac{1}{2}\sqrt{3}) + (\frac{1}{2}\sqrt{2})\ (\frac{1}{2}) = 0.965925$.

As a check against these figures, Sin $(2U) = 2 \text{ Sin } U \times \text{Cos } U$; from which $\frac{1}{2} = \text{Sin } 30° = 2 \times 0.25882 \times 0.965925 = 0.50000+$.

For 7° 30′: Sin $(7\frac{1}{2}°) = \text{Sin } (\frac{1}{2} \times 15°)$. Now Cos $U = 1 - 2 \text{ Sin}^2 (\frac{1}{2}U)$. Hence $\text{Sin}^2 (\frac{1}{2}U) = \frac{1}{2}(1 - \text{Cos } U)$. From which, Sin $(\frac{1}{2}U) = \sqrt{\frac{1}{2}(1 - \text{Cos } U)}$; also Cos $(\frac{1}{2}U) = \sqrt{1 - \text{Sin}^2(\frac{1}{2}U)} = \sqrt{1 - \frac{1}{2}(1 - \text{Cos } U)}$. Therefore Sin $(7\frac{1}{2}°) = \sqrt{\frac{1}{2}(1 - \text{Cos } 15°)} = \sqrt{0.0170375} = 0.13053$; and Cos $(7\frac{1}{2}°) = \sqrt{1 - \frac{1}{2}(1 - \text{Cos } 15°)} = \sqrt{0.9829625} = 0.99144$.

As a check: $0.25882 = \text{Sin } 15° = 2 \text{ Sin } (7\frac{1}{2}°) \times \text{Cos } (7\frac{1}{2}°) = 2 \times 0.13053 \times 0.99144 = 0.25882+$.

We could apply the formulas for Sin $(3U)$ and Cos $(3U)$ and, by solving the cubic equation, we could get direct values for Sin 5° and Cos 5°; but this is too much work; and we will take 3° 45′ or $3\frac{3}{4}°$ as our final basic angle. Sin $(3\frac{3}{4}°) = \text{Sin } (\frac{1}{2} \times 7\frac{1}{2}°)$.

Hence Sin $(3\frac{3}{4}°) = \sqrt{\frac{1}{2}(1 - \text{Cos } 7\frac{1}{2}°)} = \sqrt{0.00428} = 0.06542$.

And Cos $(3\frac{3}{4}°) = \sqrt{1 - \frac{1}{2}(1 - \text{Cos } 7\frac{1}{2}°)} = \sqrt{0.99572} = 0.99785$.

As a check: Sin $(7\frac{1}{2}°) = 0.13053$, and $2 \times 0.06542 \times 0.99785 = 0.13055+$.

It will usually not pay to bother with $3\frac{3}{4}°$, unless angles near its size occur in several different places.

This completes all basic determinations, and we will derive the functions of other angles from the formulas for Sine and Cosine of $U \pm V$. The Cosine of very small angles can be taken as unity; and we can assume the Sine to be the number of minutes in the angle, times 0.0002909.

To determine where this rule ends, take the function $\text{Sin } U = U - \frac{1}{3 \times 2 \times 1} U^3 + \frac{1}{5 \times 4 \times 3 \times 2 \times 1} U^5 \ldots\ldots$, and let M = the number of minutes in angle U. Then 0.0002909 M is the numeric value of U.

Setting this value into our formula, we find $\text{Sin } U = U - 4.1028 \times 10^{-12} \times M^3 + \ldots\ldots$

And $U - \text{Sin } U = +4.1028 \times 10^{-12} \times M^3 - \ldots\ldots$, which is the amount of error in excess of the true Sine. For ordinary purposes we can drop the remainder of the series.

If our maximum error is to be $0.0001 = 10^{-4}$, we see that $0.0001 = +4.1028 \times 10^{-12} M^3$.

Or $M^3 = \frac{10^{-4}}{4.1028 \times 10^{-12}} = 24.4 \times 10^6$; from which $M = 100 \sqrt[3]{24.4} = 290$ minutes, which is practically 5°.

This shows us that, for an accuracy of 0.0001, we can break to the nearest 5° for the Sine; and if over 2° 30′, we should subtract 0.0001 from 0.00029M for the exact Sine.

For the Cosine, take the formula $\text{Cos } U = 1 - \frac{1}{2 \times 1} U^2 + \frac{1}{4 \times 3 \times 2 \times 1} U^4 - \ldots\ldots$

Setting in the value of $U = 0.0002909M$, we obtain $\text{Cos } U = 1 - 4.234 \times 10^{-8} \times M^2 + \ldots\ldots$

And $1 - \text{Cos } U = +4.234 \times 10^{-8} \times M^2 - \ldots\ldots$, which is the amount of error due to taking Cos $U = 1$. For ordinary work we can drop the remainder of the series.

If our maximum error is to be $0.0001 = 10^{-4}$, we can find M by making $M^2 = \frac{10^{-4}}{4.234 \times 10^{-8}} = 2362$, and $M = \sqrt[2]{2362} = 48$ minutes.

This means that, for an accuracy of 0.0001, we can only break the Cosine to the nearest 48′; and if over 24′, we should take 0.9999 instead of 1 for the exact Cosine.

But, as we do not want to waste the 5° allowable for Sine, we can either take Cos $U = \sqrt{1 - \text{Sin}^2\ U} = (1 - \text{Sin}^2\ U)^{\frac{1}{2}} = (1 - \frac{1}{2}\ \text{Sin}^2\ U + \ldots\ldots)$; or we can use Cos $U = 1 - 2\ \text{Sin}^2\ (\frac{1}{2}U)$.

Since U was determined as small enough to cause its Sine to be proportional to the number of minutes contained, $\frac{1}{2}\ \text{Sin}^2\ U$ should $= 2\ \text{Sin}^2\ (\frac{1}{2}U)$, within the limits of required accuracy.

We are now prepared to apply these principles to actual work. In Fig. 3, I show a three-course traverse for which we desire the closing line DA. I believe that this traverse will be sufficient to explain all ordinary cases.

For the first course, N 30° 30′ E, 202.2 ft.: Sin (30° 30′) = Sin (30° + 30′) = Sin 30° × Cos 30′ + Cos 30° × Sin 30′.

Sin 30° = ½; and, since 30′ is within our allowable 48′ but more than 24′, Cos 30′ = 0.9999; making Sin 30° × Cos 30′ = 0.49995. Cos 30° = 0.86603; and 30′, being less than 2½°, its exact Sine is 0.0002909 × 30 = 0.00873; making Cos 30° × Sin 30′ = 0.00754. The final summary is Sin (30° 30′) = 0.49995 + 0.00754 = 0.50749.

We can check this by a direct method, as follows: Sin $U = U - \frac{1}{3 \times 2 \times 1}\ U^3 + \frac{1}{5 \times 4 \times 3 \times 2 \times 1}\ U^5 - \ldots\ldots = U - 1/6\ U^3 + 1/120\ U^5 - \ldots\ldots = U - 1/6\ U^3 + \frac{3}{10\ U}\ (1/6\ U^3)^2 - \ldots\ldots$

Using our former substitution of $U = 0.0002909\ M$, we find Sin $U = 0.0002909\ M - 4.1028 \times 10^{-12} \times M^3 + \frac{3}{0.0002909M}\ (4.1028 \times 10^{-12} \times M^3)^2 - \ldots\ldots = 0.0002909M - 4.1028 \times 10^{-12} \times M^3 + \frac{1031}{M}\ (4.1028 \times 10^{-12} \times M^3)^2 - \ldots\ldots$ That will be far enough to carry this series, except in special cases.

U = 30° 30′ = 1830′; therefore M = 1830. Applying this value in our formula, we obtain Sin (30° 30′) = 0.53235 − 0.02514 + 0.00035 = 0.50756.

Cos (30° 30′) = Cos (30° + 30′) = Cos 30° × Cos 30′ − Sin 30° × Sin 30′. Cos 30° = 0.86603; Cos 30′ = 0.9999; hence, Cos 30° × Cos 30′ = 0.86599. Sin 30° = ½; Sin 30′ = 0.00873; therefore, Sin 30° × Sin 30′ = 0.004365. Summarizing, we find Cos (30° 30′) = 0.86599 − 0.004365 = 0.861625.

By the direct method: Cos $U = 1 - \frac{1}{2 \times 1}\ U^2 + \frac{1}{4 \times 3 \times 2 \times 1}\ U^4 - \ldots\ldots = 1 - \frac{1}{2}U + \frac{1}{6}\ (\frac{1}{2}U^2)^2 - \ldots\ldots$ Replacing U by its equivalent M, Cos $U = 1 - 4.23114 \times 10^{-8} \times M^2 + \frac{1}{6}\ (4.23114 \times 10^{-8} \times M^2)^2 - \ldots\ldots$, which is far enough to take the series for ordinary work.

For M = 1830, Cos (30°30′) = 1 − 0.141697 + 0.003393 = 0.861696.

We can now obtain our latitudes and departures by taking: Lat = 202.2 × Cos (30°30′) = 202.2 × 0.86166 = 174.23 ft., North. Dep = 202.2 × Sin (30°30′) = 202.2 × 0.50752 = 102.62 ft., East.

For the second course, N 37°45′ W, 101.1 ft.: Sin (37°45′) = Sin (30° + 7°45′) = Sin 30° × Cos (7°45′) + Cos 30° × Sin (7°45′) = Sin 30° × Cos (7½° + 15′) + Cos 30° × Sin (7½° + 15′) = Sin 30° (Cos 7½° × Cos 15′ − Sin 7½° × Sin 15′) + Cos 30° (Sin 7½° × Cos 15′ + Cos 7½° × Sin 15′) = Sin 30° × Cos 7½° × Cos 15′ − Sin 30° × Sin 7½° × Sin 15′ + Cos 30° × Sin 7½° × Cos 15′ + Cos 30° × Cos 7½° × Sin 15′.

For the above formula, we have derived: Sin 30° = ½; Cos 7½° = 0.99144; and we can see, by our rules for accuracy, that Cos 15′ = 1; Sin 7½° = 0.13053; and, by our rules for accuracy, Sin 15′ = 15 × 0.0002909 = 0.00436; Cos 30° = 0.86603; from which Sin (37°45′) = ½ × 0.99144 − ½ × 0.13053 × 0.00436 + 0.86603 × 0.13053 + 0.86603 × 0.99144 × 0.00436 = 0.61223.

(Note. In multiplying by such numbers as 0.99144, it is usually better practice to call 0.99144 = 1 − 0.00856.)

By the direct method: 37°45′ = 2265 = M.

Applying this in our formula Sin $U = 0.0002909M - 4.1028 \times 10^{-12}\ M^2 + \frac{1031}{M}\ (4.1028 \times 10^{-12}\ M^3)^2$, we find Sin (37°45′) = 0.65889 − 0.04767 + 0.00104 = 0.61226.

Now, Cos (37°45′) = Cos (30° + 7°45′) = Cos 30° × Cos (7°45′) − Sin 30° × Sin (7°45′) = Cos 30° × Cos (7½° + 15′) − Sin 30° × Sin (7½° + 15′) = Cos 30° (Cos 7½° × Cos 15′ − Sin 7½° × Sin 15′) − Sin 30° (Sin 7½° × Cos 15′ + Cos 7½° × Sin 15′) = Cos 30° × Cos 7½° × Cos 15′ − Cos 30° × Sin 7½° × Sin 15′ − Sin 30° × Sin 7½° × Cos 15′ − Sin 30° × Cos 7½° × Sin 15′.

By placing in our derived values, we find: Cos (37°45′) = 0.86603 × 0.99144 − 0.86603 × 0.13053 × 0.00436 − ½ × 0.13053 − ½ × 0.99144 × 0.00436 = 0.79073.

By the direct method: Cos (2265′) = 1 − 4.23114 × $10^{-8} \times M^2 + \frac{1}{6}\ (4.23114 \times 10^{-8} \times M^2)^2$ = 1 − 0.21706 + 0.00785 = 0.79079.

We can now obtain our latitudes and departures by taking: Lat = 101.1 × Cos (37°45′) = 101.1 × 0.79076 = 79.95 ft., North. Dep = 101.1 × Sin (37°45′) = 101.1 × 0.61224 = 61.90 ft., West.

For the final course, N 71°02′ E, 125.0 ft.: Sin (71° 02′) = Sin (75° − 3°58′) = Sin 75° × Cos (3°58′) − Cos 75° × Sin (3°58′).

In this case, for a change of procedure, I will derive the separate Sines and Cosines before starting the final calculations. Sin 75° = Sin (45° + 30°) = Sin 45° × Cos 30° + Cos 45° × Sin 30° = $\frac{1}{2}\sqrt{2}$ (Sin 30° + Cos 30°). I express the functions in this form in order to show a method of calculation that at times may prove of great service.

Let us consider Sin U + Cos U: (Sin U + Cos U)² = Sin² U + Cos² U + 2 × Sin U × Cos U = 1 + Sin (2U). Therefore, Sin U + Cos U = $\sqrt{1 + \text{Sin}\ (2U)}$.

In the same way it can be shown that Sin U − Cos U, and Cos U − Sin U = $\sqrt{1 - \text{Sin}\ (2U)}$, depending upon whether U is greater or less than 45°.

From the above we see:

Sin 75° = $\frac{1}{2}\sqrt{2} \times \sqrt{1 + \text{Sin}\ 60} = \frac{1}{2}\sqrt{2(1 + 0.86603)} = \sqrt{\frac{1.86603}{2}} = 0.96593$.

Cos 75° = Cos (45° + 30°) = Cos 45° × Cos 30° − Sin 45° × Sin 30° = $\frac{1}{2}\sqrt{2}$(Cos 30° − Sin 30°) = $\sqrt{\frac{1}{2}}$

$\times \sqrt{1 - \text{Sin } 60°} = \sqrt{\frac{1 - 0.86603}{2}} = \sqrt{0.066985}$ $= 0.25880$.

As a check against the above calculations, we have already derived the Sine of 15° (the complement of 75°) to be 0.25882; and the Cosine to be 0.965925.

If this large angle was checked by the direct method, we should use one or more term in both the Sine and Cosine series, if very accurate work is desired.

Sin (3°58′) = Sin 3° × Cos 58′ + Cos 3° × Sin 58′.

The 58′ is so close to our allowable 48′ that we can take its Cosine as 0.9999.

The 3° is under 5° and over 2½°, so we will take its Sine as $0.0002909 \times 180 - 0.0001 = 0.05226$.

Sin 58′ = $0.0002909 \times 58 = 0.01687$.

Cos 3° can be taken as $1 - \frac{1}{2} \text{Sin}^2 3° = 1 - \frac{1}{2}(0.05226)^2 =$ 0.99863.

From which we find, Sin (3°58′) = 0.05226×0.9999 + $0.99863 \times 0.01687 = 0.06910$.

By the direct method:

3°58′ = 238′ = M.

Sin $U = 0.0002909M - 4.1028 \times 10^{-12} \times M^3 + \ldots\ldots$

In this it can be seen at a glance that only two terms are necessary, making:

Sin (3°58′) = $0.0002909 \times 238 - 4.1028 \times 10^{-12} \times$ $(238)^3 = 0.06923 - 0.00006 = 0.06917$.

Cos (3°58′) = Cos 3° × Cos 58′ − Sin 3° × Sin 58′ = $0.99863 \times 0.9999 - 0.05226 \times 0.01687 = 0.99765$.

By the direct method: Cos $U = 1 - 4.23114 \times 10^{-8} \times M^2 - \ldots\ldots$; in which it can be seen that the remainder of the series can be eliminated.

For M = 238, Cos (3°58′) = 1 − 0.00240 = 0.99760.

Introducing the derived values, we find:

Sin (71°02′) = $0.96593 \times 0.99763 - 0.25881 \times 0.6913$ $= 0.94575$.

Cos (71°02′) = Cos (75° − 3°58′) = Cos 75° × Cos (3°58′) + Sin 75° × Sin (3°58′) = $0.25881 \times$ $0.99763 + 0.96593 \times 0.06913 = 0.32507$.

This gives:

Lat = 125 × Cos (71°02′) = 125 × 0.32507 = 40.63 ft., North.

Dep = 125 × Sin (71°02′) = 125 × 0.94575 = 188.22 ft., East.

(Note. In multiplying by such a number as 125, multiply by 1000 and divide by 8.)

Summarizing the traverse, we have:

First course, 174.23 ft. North; 102.62 ft. East.
Second course, 79.95 ft. North; 61.90 ft. West.
Third course, 40.63 ft. North; 118.22 ft. East.

The total North is 294.81 ft.; the total East is 220.84 ft.; from which deduct the 61.90 ft. West, leaving a net East of 158.94 ft. To close, return South 294.81 ft., and West 158.94 ft. This gives a right triangle of which the base is 158.94 ft.; the altitude is 294.81 ft.; and the hypothenuse is the closing line; from which the closing distance, or hypotenuse is

$$\sqrt{(294.81)^2 + (158.94)^2} = 334.93 \text{ ft.}$$

The Sine of the closing bearing will be $\frac{158.94}{334.93} =$ 0.47455, which divide by 0.00029 for the approximate angle.

$\frac{0.47455}{0.00029} = 1636' = 27°16'$.

This shows that the desired angle is, $U = (30° - V)$.

Sin U = Sin 30° × Cos V − Cos 30° × Sin V

Cos U = Cos 30° × Cos V + Sin 30° × Sin V

Replacing by the known values, we find:

$0.47455 = \frac{1}{2} \text{Cos } V - \frac{1}{2}\sqrt{3} \times \text{Sin } V$

$\text{Cos } U = \frac{294.81}{334.93} = 0.88021 = \frac{1}{2}\sqrt{3} \times \text{Cos } V + \frac{1}{2}\text{Sin } V.$

Multiplying the first equation by $\sqrt{3}$, we have:

$\sqrt{3} \times 0.47455 = \frac{1}{2}\sqrt{3} \times \text{Cos } V - 3/2 \text{ Sin } V.$

Subtracting the last equation from the one above, we obtain: $0.88021 - \sqrt{3} \times 0.47455 = (\frac{1}{2} + 3/2)$ Sin $V =$ 2 Sin $V = 0.05826$.

From this Sin $V = 0.02913$; and $V = \frac{0.02913}{0.0002909} =$ $100' = 1°40'$.

$U = (30° - V) = 28°20'$.

Which shows that the desired closing line is S. 28°20′ W., 334.93 ft. As before stated, I am making these calculations where I have no means of checking by the use of tables, but I feel confident that this closing line will prove to be correct.

In this kind of work there are no fixed rules. I have attempted to explain general principles, and to cover the most typical cases. From a practical standpoint, I prefer to calculate the large angles by the breaking-up process, and the small ones by the direct method. In presenting this article I am especially desirous of helping young engineers who are in training for military service. If they thoroughly grasp the principles involved, they will be in a position to make all necessary calculations, even if their tabular data should be completely destroyed by shell-fire.

MAKERS OF POTTERY in the United States reported another record-breaking year in 1917, which was $56,162,522, an increase of $7,945,280, or more than 16% over the value in 1916, according to figures compiled under the direction of Jefferson Middleton, of the U. S. Geological Survey. Ohio led with products worth $21,353,706, followed by New Jersey with $12,535,843, West Virginia with $7,243,900, New York with $4,076,817, and Pennsylvania with $3,194,944. California contributed 1.09% of the total.

THE FINAL FIGURES for lime burned and sold in the United States in 1917 are 3,786,364 short tons, valued at $23,807,877, as determined by G. F. Loughlin, U. S. Geological Survey. This is a decrease of 7% in quantity, but an increase of 28.6% in value when compared with the figures for 1916.

ELECTRIC FURNACES are responsible for the manufacture of such important products as aluminum, armorplate, calcium carbide, carborundum, graphite, high-speed steels, and silicon.

BUTTE, MONTANA

Litigation Over the Cement Copper Flotation Process.

The taking of testimony in the litigation between B. H. Dosenbach, consulting engineer for the Butte & Superior Mining Co. and other Jackling interests, and Milton F. Webster of the Merrill Metallurgical Co. of San Francisco, was recently concluded here. The suit was over the question as to who was the inventor of the process now known as the 'cement copper flotation process'. Upon the determination of the real inventor will depend the issuance of the United States Patent for the process. The taking of testimony started at Butte on September 23. Mr. Dosenbach was represented by J. Bruce Kremer of Butte and M. Coit of Washington; while Mr. Webster was represented by Archibald Cox and Harry A. English of New York. The testimony is of a highly technical character and very lengthy. The record will be printed and forwarded to Washington, where briefs will be submitted and arguments made on January 11, 1919.

The process is as follows: Oxide or carbonate ore ground fine is placed in a leaching-apparatus where the copper minerals are dissolved by sulphuric acid. After dissolution, the pulp containing the copper sulphate is placed in a tube-mill or other suitable vessel containing scrap or sponge iron, when the copper is precipitated as cement copper. The recovery of the cement metal from the pulp is effected by flotation, either in a pneumatic or other flotation apparatus. Mr. Dosenbach has already erected a large plant for the Chino Copper Co. at Hurley, New Mexico, which is treating low-grade oxide ores satisfactorily.

One strange feature of the case is that both patentees assert that they made the discovery at approximately the same time. Mr. Dosenbach, at the time of his discovery in November 1914, was engaged in making experiments on the zinc-sulphide ore of the Butte & Superior Mining Co., and was using copper sulphate as one of the reagents in the operation. He discovered that metallic copper was precipitated from solution in the pulp upon the iron parts of the experimental machine, and that particles worn off were floated with the zinc sulphates. He immediately started experimenting upon copper-oxide ores, with the resulting process described in the patent. Mr. Webster claims that he made the discovery in December 1914, at Spokane, Washington, while engaged in testing the leaching and precipitation of carbonate ores, and found that copper could be precipitated in the pulp. He afterward thought of separating by gravity concentration and later by flotation. The outcome of this litigation will be awaited with interest, as the process is particularly adapted to the low-grade oxide and carbonate ores that cannot be treated profitably by any other method.

The second furnace of the ferro-manganese plant at Great Falls has been blown-in.

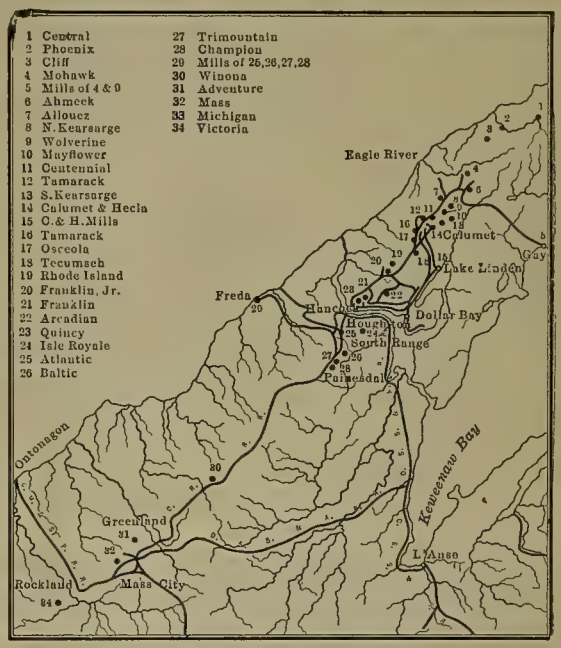
The new stack at the Washoe Reduction Works is nearing completion.

The Butte Copper & Zinc Mining Co., a subsidiary company of the Anaconda Copper Mining Co., has purchased the Ophir mine, and connection is to be made with the Emma zinc mine.

HOUGHTON, MICHIGAN

Labor.—Accidents.—Quincy to Build Re-grinding Plant.—Mohawk's Condition.—Women in Stamp-Mills.

Men are beginning to return to the Copper Country in small numbers; but larger numbers are expected if the reports of those coming back are correct. They explain that most of the men who have been attracted by higher wages paid to war workers now fear that they will have no jobs at all when the War is concluded, and they have learned that living conditions in the Copper Country have some ad-



THE COPPER COUNTRY, MICHIGAN

vantages not to be secured elsewhere. They remember also that, when reverses do come, these copper mines are always better able to weather financial and industrial crises than the average industry and that chances for a permanent position are better here than elsewhere. The thing that impresses the men who went away from this district to take war jobs is the difference in house rent. Most of them lived here in company houses, paying $5 or $6 per month; a similar house in the city cost from $30 to $40 per month. Besides that, the men were so far from their work that they spent a couple of hours daily on the street-cars, to say nothing of the cost of transportation.

There were 31 fatalities in Houghton county mines during the last fiscal year, according to the annual report of Alfred James, mine inspector. The total working force on hazardous occupations was 12,650, a smaller number than in a number of years. The percentage of fatal accidents is higher, notwithstanding the general use of numerous safety-first appliances. The explanation is that the mines have

lost many of their skilled men to the Army and have a large number of unskilled men trying to do their work. The percentage of fatalities for a decade is 0.0026. The high point was in 1908, when 17,974 men were employed, the percentage that year being 0.0035. In 1915 it was 0.0021, when 16,005 men were employed.

The Quincy company is building extensive additions to the stamp-mill at Mason. A complete re-grinding and flotation plant, similar to those in use at the Calumet & Hecla mill at Lake Linden, is to be put in. Extensive tests were made in a small mill on the sands. This plant has been contributing 25 tons of copper per month to the Quincy smelter, and has proved conclusively that the Pewabic lode formation offers a chance to save considerable copper by the extension of the additional concentrating plant. The new hoist at No. 2 shaft is enclosed in its new building, which is of architectural beauty as well as a practical engine-house. The engine is being set up rapidly.

Mohawk is harder hit than any other mine in the district by the labor shortage, and will be the last to recover because it is not close enough to the social centre to attract men. The ore output is averaging 1600 tons daily compared with 2500 tons under normal conditions. The ore is of higher grade lately, improving from 19 lb. to 26 lb. per ton. This is due to better underground conditions, as well as selection of ore.

Ore shipments to mills during October were as follows: Ahmeek, 94,000 tons; Allouez, 40,000 tons; Hancock, 75,000 tons; Isle Royale, 28,000 tons; Mass, 14,000 tons; La Salle, 15,000 tons; Osceola, 94,000 tons; and Superior, 7500 tons.

The new turbine at the Lake Linden plant is working satisfactorily. Calumet & Hecla's electric plant is now capable of generating 30,000 hp. This is utilized at the mine, at the mill, and is transmitted 12 miles for pumping water from the plant on the shores of Lake Superior.

The Lake Milling, Smelting & Refining Co., a Calumet & Hecla subsidiary that does custom milling for the Isle Royale, Hancock, and others, is now successfully employing women as head feeders. Women also have taken the place of men in the Calumet & Hecla leaching and flotation plants.

CRIPPLE CREEK, COLORADO

Gold Yield and Dividends.—Cresson Output.—Modoc Consolidated.

Gold production of the district during November totaled 88,700 tons, averaging $9.64 per ton. The gross total was $855,283. Compared with September there is an increase of 10,965 tons and $129,735.

Dividends paid in October totaled $242,000, as follows: Cresson, $122,000; Portland, $60,000; Golden Cycle, $45,000; and Vindicator, $15,000. The total paid this year amounts to $2,230,000.

During the year ended August 31, the Cresson Consolidated Gold Mining & Milling Co. produced a total of 108,336 oz. of gold, valued at $2,240,388. The gross production to date is $12,886,146. With the monthly payment of 10c., equal to $122,000, on November 10, dividends total $7,027,163.

The Modoc Consolidated Mines Co., in a supplemental report, announces that the final details of the merger arrangements between the Catherine and the Modoc have been completed, and that the Modoc is now operating the Last Dollar mine as well as the Modoc. The consolidation has added largely to the company's holdings, providing a deep working-shaft—1500 ft. deep—with powerful machinery capable of operating to a depth of 2000 ft. It is further advised that in exploring on the 1200-ft. level of the Last Dollar a large orebody has been found. Ore shipments are being made and the ore available assures funds to develop the mine.

PLATTEVILLE, WISCONSIN

Conditions in the Zinc Region During October.

During October the zinc region was practically demoralized by irregular prices for ore and spelter and by the influenza epidemic. The disease attacked all alike—from managers to common labor. The mining companies were keen in their efforts to help those stricken and their dependents. Lead-ore prices remained firm, with good demand. Some short-lived competition sent the price to $104 per ton. Production of pyrite from mines is still negligible, the zinc-ore separating-plants contributing most of this product. The price is unchanged at 25c. per unit of sulphur.

Shipments of mine ore to refiners in the field and smelters for 26 days totaled 13,105 tons of zinc, 625 tons of lead, and 1993 tons of pyrite. Deliveries from refineries totaled 6712 tons.

RENO, NEVADA

Aid to Gold Mining.—Recovering Precious Metals from Carson River.—Tungsten Near Sodaville.—National and Rochester.

Raymond T. Baker, Director of the Mint, and U. S. Senator Charles B. Henderson, of Nevada, attended a meeting at Reno on October 30 of the executive committee of the American Gold Conference, composed of Bulkeley Wells of Colorado; J. A. Fulton of Melones, California; and Whitman Symmes of Virginia City, Nevada; with Henry M. Rives, secretary of the Conference. It was announced that the committee was engaged in preparing statistics and information relating to the difficulties now confronting gold mining, which will be presented to Congress in the endeavor to secure relief for the gold producers. The committee will proceed to Washington shortly to present its case, and Senator Henderson promised to call a special meeting of the Senate committee on mines and mining, of which he is chairman, to meet the members of the Gold Conference and discuss legislative measures to aid gold mining. Mr. Baker declared that the Secretary of the Treasury, W. G. McAdoo, was keenly interested in the gold situation, that he had expressed a desire to extend all possible aid to the industry, and that he had formulated certain plans for stimulating gold production, which he would submit to the gold producers upon their arrival at Washington. Many phases of the gold mining situation were discussed and it was agreed that relief to the industry must be prompt to avert a critical condition in the gold-producing regions. Members of the committee were promised a cordial reception at Washington, with every facility at the command of the Treasury department, the Senate mines committee, and the Director of the Mint in obtaining a hearing of their case.

Material for a 7-ft. Armco iron flume is in transit to the point on the Carson river, between Empire and Dayton, where the Unevida Gold Mining Co., under the management of W. C. Ralston, Jr., is sluicing the tailing from the mills that treated by pan-amalgamation ore from the Comstock mines during the 'sixties and 'seventies. The flume will be used to divert the water and drain pools in the river-bed. A 4-in. centrifugal pump delivers the sand and gravel of the river-bed to a sump, whence they are raised by a 3-in. centrifugal to the head of a 65-ft. sluice. Concentrate from the sluice is rich in amalgam, fine gold, and virgin quicksilver. Tests on the fine, below the sluice, point to concentration on tables as the best method of recovering the metals in the black sand. Bedrock has been reached at one point by a 14-ft. shaft sunk in the Santiago bar, and the sand from the bottom of this shaft yields spoonfuls of virgin quicksilver in the pan. One yard of dirt from the Santiago tail-race was washed and the resulting concentrate was tested in a San Francisco laboratory. The value of the content was $123.66. This concentrate yielded 4 lb. quicksilver, $89.91

in bullion from the coarse sand, and the fine was sold for $1.35 per lb. One sample of concentrate from the sluice, tested at San Francisco, assayed $3565.57 gold, $275.50 silver, and $430.40 mercury, or a total value of $4271.47 per ton. High water in the river, resulting from recent heavy rains in the Sierras, has interfered with the work of the testing-plant, but the movable flume and sand-bag diversion dam will remove this difficulty, and the first pumping unit is expected to begin quantity production within 60 days.

Mining continues active in Mineral county. Twelve miles south-west of Sodaville, two tungsten mills are nearly completed, having a combined capacity of over 150 tons daily, while a third mill is proposed. High-grade scheelite has been shipped from ground here and a large quantity of milling-grade ore is said to have been opened for the new plants. Other tungsten deposits have been opened west of Sodaville and nearer the railroad.

Mines at National, in the northern part of Humboldt county, are producing rich gold ore, but in smaller volume than formerly; nearly all work at present is by lessees.

The corporate name of the Rochester Combined Mines Co. has been changed to the Silver State Mines Co., because of confusion resulting from similarity to other names in the district. Reports authorized by the management say that the new mill is treating 175 tons daily and is working satisfactorily.

TUCSON, ARIZONA

Preparations for a Geological Survey of Arizona.

The location of mineral districts not now being developed, also of oil districts, is predicted for the geological survey of Arizona which has just been undertaken by the State Bureau of Mines. This is known as one of the richest mineralized areas, but only small sections of it have been geologically examined. "The information will be of great value," said G. Montague Butler, director of the Bureau and dean of the School of Mines and Engineering of the State University, "inasmuch as when it is all at hand it will enable us to point out to prospectors favorable localities for certain things. It will enable us to speak with especial authority on the oil situation, which is engaging so large an amount of interest just now. We will be able to direct the search for coal deposits, artesian water, and a great variety of non-metallic substances, including clay and gypsum. Less is known of the geologic character of Arizona than of any other State. There are some counties of which we know nothing at all. The U. S. Geological Survey has made investigation in small districts but there does not exist anything like a comprehensive knowledge of the State's geology. Fully half the questions that reach the Arizona Bureau of Mines relate to the geology of the State, and it is anticipated that this work will enable the Bureau to answer a much larger proportion of these questions than has been possible in the past."

Olaf P. Jenkins has been appointed geologist by the board of regents of the University, under whose direction the Bureau is placed. His first work will be the preparation of a reconnaissance geological map. After completing this, the Bureau proposes to issue bulletins covering the geology and mineral resources of every county, and at this time more detailed geological investigations will be made and maps prepared of promising mineralized areas. The new geologist is a graduate of Leland Stanford University, of California. In 1911 he accompanied J. C. Branner, president of Leland Stanford, to Brazil, and assisted him in the collection of data which Mr. Branner later embodied in a geological map of that country. Mr. Jenkins served for some time as assistant geologist of Tennessee and in that capacity got out the last geological map of that State. Late in 1916 he was assistant professor of geology at Washington State College.

JOPLIN, MISSOURI

Ore-Producers and Zinc Smelters Arrange Prices for Ore.

The report of a committee of ore-producers that met with a committee of smelters at New York, and tentatively agreed upon marketing a specified tonnage of second-grade ore by January 1919, is exciting attention. The complete worsting of the ore-producers in the bargain seems apparent from a study of the schedules prepared. The committee reported to a meeting of producers on October 26 as follows:

Your committee, composed of the following: O. F. Brinton, Howard I. Young, F. N. Bendelari, John W. Hoffman, and W. B. Shackelford, met with the zinc committee at New York and the following resolution was prepared in conference with the zinc committee, to be presented to the smelters and operators for acceptance:

Whereas, a committee selected by the Joplin Ore Producers Association has met with the zinc producers committee appointed at the instance of Eugene Meyer, Jr., of the War Industries Board, to devise some plan for ensuring the continued operation of the Joplin mines, and to avoid an excessive 'spread' between the price of ore and the price of spelter, which has occurred and is likely to occur again, and meeting for such purposes having been held on October 15, 16, and 18, 1918; therefore, be it

THE ZINC REGION OF THE FOUR STATES

Resolved, That we recommend the following plan:

1. That the smelters will specify the quantity of ore that they will obligate themselves to take in approximately equal weekly quantities during the period ending January 1, 1919, and the ore-producers will furnish such tonnage, both subject to fires, strikes, accidents or other causes beyond the control of either party interrupting, curtailing, or suspending operations at smelters or mines, and neither party shall be liable for damages due to such interruptions, curtailment, or suspension.

2. That the ratio shown in the following table shall be the basis of the settlement for 60% zinc Joplin mill concentrates, subject to the variation of $1 for each unit above or below 60% zinc content, and subject to the customary lime and iron penalties of $1 for each unit of these ingredients in excess of 1%. Sludge material running not below 57½% zinc shall be penalized $2.50 per ton; sludge material

assaying less than 57½% and all flotation material shall be penalized $5 per ton. This schedule shall not apply to any ore below 50% zinc.

3. The market price of spelter governing settlements will be posted by the Joplin Ore Producers Association each Friday, and shall govern for one week. The quotation to be posted by the Joplin Ore Producers Association shall be the average of the daily quotation for prime Western spelter at St. Louis as given in the 'Engineering and Mining Journal' for the week ending the Wednesday previous to the Friday of the week in which the quotation is posted.

4. With such modifications as may be found necessary, this arrangement shall be continued from quarter year to quarter year as long as it is found feasible and satisfactory.

The scale of ratios between ore and metal was also worked out and is an equitable division of profit and loss as between the smelter and the miner based on the average cost of mining and smelting. The proposed scale is as follows:

Proposed Basis of Settlement for 60% Zinc Joplin Mill Concentrates at Various Spelter Markets

Spelter market, cents	Ratio	Price of 60% Joplin ore at mines
6.0	6.80 to 1	$40.800
6.1	6.79 to 1	41.419
6.2	6.78 to 1	42.036

This ratio goes on: for every tenth of a cent rise in the price of spelter, the ratio decreases one hundredth so that the scale goes on indefinitely. Even though spelter went to 15c. per lb, the producer would still be getting but $88.50 for his ore. This ore would cost him on the average above $60. His profit then would not be in excess of $28.50. If the smelter only obtained an 85% recovery he would get 1020 lb. of metal, which sold at 15c. would bring $153 gross. Allowing him $27.50 for a smelting charge, which would take care of a 100% increase in the cost of smelting, and deducting this and the price paid for the ore would leave a profit to the smelter of $37.50 per ton of ore smelted. This does not take into consideration any profit the smelter may obtain from the sulphur in the ore, which normally amounts to one ton of sulphuric acid for every ton of ore treated if his plant is equipped to manufacture acid. Thus one beholds a manufacturing business with small if any risk, making a 35% greater profit than the mining business which has many risks. The acid-maker still has his acid to add to his profit.

On the other hand, take a lower price for spelter for an example: At 8c. for spelter, the producer gets $52.80. This is certainly either cost or below the cost of production. The smelter would still have a margin of $28.80, or on the same basis as before, a profit of $1.80 per ton plus the acid. Any way the new arrangement is viewed it is a victory for the zinc smelters. On top of the ratio discrimination the very basis of spelter quotations is the journal aforesaid, whose spelter quotations have always been scouted by the mine operators of the Joplin district as strongly prejudicial in favor of the smelters as against the ore-producers.

Efforts are being made to have all second-grade ore-producers sign-up the agreement as soon as possible.

CHILE

Chuquicamata.—During the second quarter of 1918 the Chile Copper Co.'s operating profit was $2,075,550, less $629,802 for interest, etc. The net balance was $1,445,748, against $1,124,498 on the previous period. The cost per pound delivered at Atlantic ports was 13.87c., a decrease of 0.52c. The leaching-plant treated 950,885 tons of 1.58% ore, of which 79.84% was recovered. The output was 24,556,156 lb. Corresponding figures for the first quarter were 829,553 tons, 1.76%, 82.54%, and 24,876,498 pounds.

ANCHORAGE, ALASKA

General News of the Adjacent Territory.

A Federal Commission has made a survey of Alaskan resources with a special reference to the coal situation. It will report to the President and Congress on the mineral and agricultural possibilities of the Territory, presenting its needs and paving the way for development. The Commission is composed of E. O. McCormick, vice-president of the Southern Pacific railroad, chairman; George Watkins Evans of the U. S. Bureau of Mines; George C. McFadden, chief engineer of the Chicago Coal Co.; and L. A. O. Gabaney, a Chicago geologist. At a banquet tendered the Federal Commission by the local Chamber of Commerce the necessities of the adjacent mining districts were presented by local speakers, and suggestions were made that the Alaskan Engineering Commission be given appropriation and authority to construct spurs, feeders, and wagon-roads, or whatever mode of transportation may be necessary to develop the country adjacent and produce tonnage for the railroad. The matter will be brought to the attention of the Secretary of the Interior.

F. Le Roi Thurmond of Anchorage recently returned from a trip to the Ohio river in the Broad Pass district. He declared there were splendid prospects of copper, lead, silver, and gold that would justify exploitation; and that the progress of the Government railroad, which is surveyed to within 15 miles of the mineralized belt, would make their early investigation possible.

The Willow Creek district has had a successful season; the yield will approximate $100,000 more than the best previous year.——The Gold Bullion mine, operated by the Willow Creek Mines Co., has run continuously since May 29, and will continue to do so until forced to close down by cold weather.——The Miller-Bartholf people have erected a Straub stamp-mill and made a test run. They report $50 per ton on the plates.

William Martin has closed down the mill of the Alaska Free Gold Mining Co., which operated during the season on ore from the Gold Cord mine under lease to Mr. Martin. Platinum is reported to have been found in Willow Creek ores by a San Francisco assayer. Local assays have failed to verify the report.

Theodore Pilger, engineer in charge of the Mable mine, left for Butte on October 24. The mine is closed for the winter, after a season devoted to development, which totaled 540 ft. A compressor was put in. The company proposes to continue operations next season.

The Anchorage Gold Mines Co. has been incorporated to develop prospects on Archangel creek in the Willow Creek district. Byron Bartholf is president; Sidney Anderson, vice-president; E. N. Culbertson, treasurer; and A. G. Thompson, secretray. The capital is $100,000, shares $1 par. The company has a number of miners employed and contemplates working through the winter.

In the Cache Creek district the Cache Creek Dredging Co. employed 45 men, operating its boat from June 15 to October 15. The dredge has a capacity of 2000 cu. yd. per day. Coal dug from the company's mine nearby is used to generate steam.

Three hydraulic outfits operated in this district. The lack of transportation is a serious deterrent to successful operations, all freight having to be hauled 50 miles over a road passable only in the winter time.

Nome.—Recent telegraphic advice sent from Nome to Seattle states that influenza is raging there, over 300 cases being reported. Doctors and nurses have been sent there, as the situation is bad. Influenza is reported to be prevalent at other mining centres of Alaska.

In the next issue of the 'Press' will be an interesting letter on general conditions in Alaska.

THE MINING SUMMARY

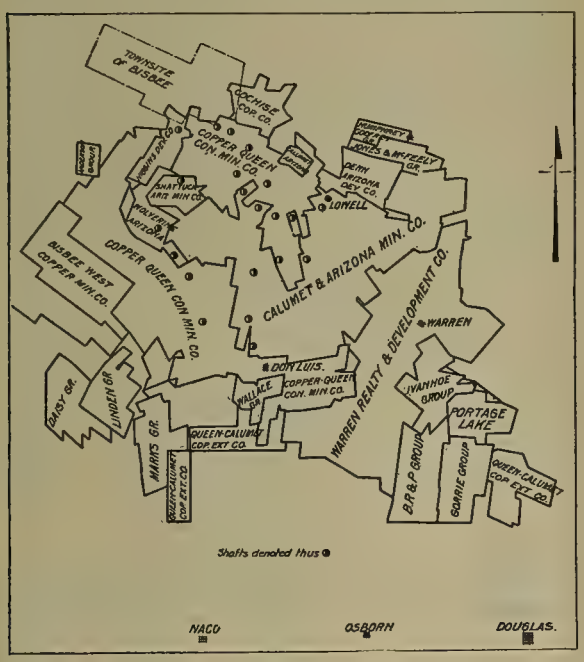
ARIZONA

Ajo.—New Cornelia pays its initial dividend, of 25c. per share, on November 25. This amounts to $300,000 on the 1,200,000 shares issued.

Douglas.—Copper production of the Phelps Dodge mines in October totaled 16,728,371 lb. Although 1,200,000 lb. more than September, it is 1,800,000 lb. below the average for the first 8 months of 1917.

Globe.—Work has been suspended at the asbestos property of the American Ores & Asbestos Co., situated in the Sierra Ancha mountains.

Hayden.—A new compressed-air pumping-plant, with 10



PROPERTY MAP OF BISBEE DISTRICT, ARIZONA

deep wells in the Gila bottom, is being installed to supply more water to the Ray Consolidated mill.

Jerome.—Directors of the United Verde Extension company report that there are no important developments at the mine. The blast-furnace at the smelter was started on July 18, and since July no ores have been shipped to outside smelters. Construction at the smelter is nearing completion, though subject to delays. The residences for the superintendent and master mechanic, and the store building have been completed at the smelter townsite. Further developments of the townsite will be limited to what is absolutely necessary. At the mine, no exploratory work of importance has been in progress. The Audrey shaft has reached a point 55 ft. below the 1600-ft. level, and the new hoist at this shaft is in service. The ore-pockets extending from the 1300 to the 1200-ft. level have been completeed. The skip-pockets that are below the 1400-ft. level have been completed. It is proposed to continue sinking the shaft until the 1700-ft. level is reached. The permanent electric power-lines have been installed in the shaft. Progress in the tunnel has been slow. Owing to an abnormal flow of water work was suspended at the Texas shaft. The water was under control and on September 15 work was resumed in the east heading from this shaft. On September 30 there was still a distance of 2600 ft. of tunnel to drive. Construction of dwellings at the townsite near the mine is under way. Good progress has been made at the Miners' hotel. Painters and plasterers have been engaged and the work is being finished at satisfactory speed. The supply of desirable labor is insufficient to satisfy the requirements of the mines. This condition has resulted from an exodus of skilled miners and mechanics to Government construction work at Nitro, West Virginia, and from British and American enlistments. The smelter in August treated 10,898 tons of ore, and in September, 12,688 tons. The estimated production for the year to September 30 is 42,236,387 lb. of copper. Cash on hand on September 30 was $1,990,882. The estimated copper shipped, returns on which have not been received, is 20,493,142 lb. The directors declared a quarterly dividend of 50c. per share and an extra dividend of 25c. per share payable on November 1.

The Jerome Superior has its two-compartment shaft down 620 ft. This shaft is about 2600 ft. from the United Verde Extension. At 500 ft. depth is a station, from which short drifts have been driven. Equipment includes a 75-hp. gasoline hoist, one 100-hp. and one 125-hp. oil-engine and compressor. Boilers of 250 hp. supply steam to the pumps. George Mitchell is in charge, with 30 men.

Kingman.—It is expected that the new leaching-plant of the Emerald Isle Copper Co. will soon be in operation.

The tunnel of the Walnut Creek Mining Co., 20 miles south-east of Kingman, is in 800 ft. So far it has opened promising ore, but the foot-wall has not been reached.

A contract has been let to drive a tunnel to cut the vein of the Missouri-Mohave mine to the north of the main shaft. Driving from the shaft on the 100-ft. level has opened some good ore.

Miami.—Owing to shortage of men, Inspiration Consolidated has been operating at times as low as 50% of capacity. At present, 15 of the 20 units in the mill are at work.

Copper production of the Miami company in October was 4,945,178 lb., practically the same as in September.

CALIFORNIA

Amador City.—The Fremont Consolidated Mining Co. has discontinued operations. The property is splendidly equipped and has always been kept in the best of repair. There are stopes that can be profitably mined under normal conditions. The cost of looking after the property in the meanwhile is considerable. In view of this, the present shareholders are unwilling to assume the risks. The underground equipment is being removed as rapidly as possible, and the lower pump was to be dismantled by the end of October. The mine will be allowed to gradually fill with

water. In the meantime the directors are so anxious to see the property redeemed from its impending fate that they have offered it for $60,000 cash. The surface equipment alone cost more than twice this sum. Arthur Goodall is manager.

Heroult.—A carload of electrodes from Niagara Falls for the Noble Electric Steel Co. was received here by express on October 26. The express bill was $1200. The electrodes were badly needed. The shipment was expedited by the War Industries Board, which has consented that other shipments in carload lots come through promptly by freight. The electrodes are 12 in. diameter and 5 ft. long. A new furnace under construction calls for electrodes 20 in. diameter.

Plymouth.—The Plymouth Consolidated reports as follows for September:

Ore treated, tons	10,700
Estimated yield (including concentrate)	£11,706
Working expenses	£7,081
Development expenditure	£1,283
Surplus	£3,342
Capital expenditure	£40

Redding.—The American Gold Dredging Co.'s new boat, across the river from Redding, started on October 23. R. K. Estep is superintendent. The boat, which was under construction for five months, cost $125,000. The company owns the Reid Ferry farm of 800 acres, most of which has been prospected. This makes the fifth dredge in operation in Shasta county.

COLORADO

Breckenridge.—The Tonopah Placers Co. made a net profit of $14,046 in the quarter ended August 31, 1918.

Garfield.—The Garfield Mining Co. is erecting a 50-ton mill on its property near here. It includes a Marcy mill, and concentration and flotation apparatus. Frank Lenox has been engaged as millman, and work is progressing rapidly. The property consists of 17 patented and 4 unpatented claims. Six thousand feet of development has been done, and large orebodies have been blocked out. From four to ten carloads of ore per month is being shipped to the Ohio Smelting Co. at Salida. The mill is expected to be in operation within 90 days.

Pitkin.—In this district the Pennsylvania Molybdenum Mines Co. is erecting a mill at its Bon Ton mine. Besides molybdenite, the ore carries copper, gold, and silver.

IDAHO

Hailey.—A deposit of graphite is said to have been found by Jesse D. Lee and his son Frank in Red Cloud gulch, 12 miles north-west of Hailey. Open-cuts show 15 ft. of clean steel graphite of a high degree of purity. It is said that an engineer in the service of the U. S. Geological Survey will examine the deposit shortly.

Wardner.—Another company proposes to explore the ground under the town of Wardner, namely, the North Bunker Hill Mining Co. It has filed 19 leases from owners of lots in the town granting the company the right to mine for 25 years under their property, paying 15% royalty to the owners. Another company, the Wardner Leasing Co., which has such leases from a large number of owners of Wardner lots, has done considerable exploration work.

MISSOURI

Joplin.—Production of the Tri-State region last week totaled 6284 tons of blende, 620 tons of calamine, and 1002 tons of lead. These averaged $55, $38, and $100 per ton, respectively. Missouri contributed $122,905 of the total of $491,725.

MONTANA

Butte.—Anaconda produced 22,345,000 lb. of copper during October. This is an increase of 1,600,000 lb. over September, but below the average for the year.

At a sheriff's sale on October 31 the Anaconda bid $57,000 for the Butte Central property for the Butte Copper & Zinc Co., which is controlled by Anaconda. The mine of the Butte Central is the Ophir. Its shaft is 2600 ft. south of the Emma mine, and a connection between the two will give the Emma an outlet through the Ophir.

Iron Mountain.—The Intermountain Copper Mining Co. has levied an assessment of 1c. per share. This is equal to $16,000.

NEVADA

Goldfield.—The Silver Pick company is to sink its shaft from 1275 to 1325 ft. As the 1260-ft. level is showing low-grade ore it was decided to sink deeper.

Tonopah.—Last week's production of the district totaled 8582 tons, valued at $145,984.

The Extension is sinking its Victor shaft 20 ft. below the 1760-ft. level to act as a sump for the collection of water. Prospecting on this level is to be started at an early date.

The North Star's last shipment to the West End mill averaged $31.08 per ton, and it is expected that the next one will equal this in value.

In driving a cross-cut 800 ft. south on its 600-ft. level, the Midway cut five separate veins from 18 to 60 in. wide. They contain from milling to shipping ore. The rock is trachyte.

During the third quarter of 1918 the Tonopah Mining Co. recovered silver and gold valued at $379,578. Net earnings totaled $143,766, less than half for the previous period. After paying $150,000 in dividends the surplus was $784,172, the same as a year ago. Loans to subsidiaries total $2,699,968.

Wonder.—The Nevada Wonder pays a dividend of 10%, equal to $150,000.

NEW JERSEY

Franklin Furnace.—The New Jersey Zinc Co. reports as follows for the third quarter of 1918, as compared with this period in previous years:

	1918	1917	1916
Net income	$5,330,781	$5,593,985	$8,304,511
Interest and reserves	115,000	115,000	115,000
Federal taxes	1,775,000	2,126,317	.....
Balance	3,440,781	3,352,668	8,189,511
Dividends	1,400,000	2,800,000	6,650,000
Surplus	2,040,781	552,668	1,539,511

OKLAHOMA

Picher.—The first ore-warehouse for the zinc districts was expected to be finished here by November 10.

Production of the various centres last week totaled 4520 tons of blende and 731 tons of lead, valued at $341,700.

UTAH

Bingham.—Utah Copper produced 19,000,000 lb. during October. In September the yield was 17,785,000 lb., and in August 19,920,000 pounds.

Park City.—This district produced 8063 tons of ore and concentrate during October.

Tintic.—The Iron Blossom paid 2½c. per share, equal to $25,000, on October 25. This makes $75,000 for 1918, and $3,185,000 to date.

WASHINGTON

Colville.—The Bruce Creek Mining Co., operating 30 miles north of this place, has opened on the surface a wide body of 50% zinc sulphide. A tunnel is in 415 ft. to develop the vein at depth. J. L. Stone is superintendent.

Loomis.—Lessees of the Copper Extension mine—Dempster brothers and others of New York—have let a contract to the Riblet Tramway Co. of Spokane to construct an

aerial tram two miles long, to connect the Copper World Extension and Copper World Mines with Palmer lake at the foot of Palmer mountain, on which they are situated. J. L. Drumheller and John Wentworth are the largest holders in the Copper World. The ore carries from 3 to 5% copper and an excess of iron and sulphur. Over 4000 tons has been sent to the smelter at Grand Forks, B. C. The tram will eliminate a steep haul of 8 miles.

Northport.—The Northport Smelting & Refining Co. has started foundations for a new drossing plant, to be erected at a cost of $50,000 to $75,000. Operation of a furnace has been suspended because of the shortage of ore from mines of the Coeur d'Alene region, due to a lack of men. The men rendered idle are engaged in the new work.

CANADA

British Columbia

Laurier.—The Tri-State Chrome Co. has a shipment of 10 cars of 40% ore ready to send to Niagara Falls. This company has a mill at Canyon City, Oregon, producing 8 tons of concentrate daily.

Ontario

Boston Creek.—The mill of the Miller-Independence will be in operation at an early date. A large quantity of ore is ready for treatment, some of which is a high-grade telluride. The mill is designed to treat the ore by a combination of amalgamation, concentration, and flotation methods.

Additional machinery for the mining plant of the Mondeau property, which was recently optioned to Detroit interests, has arrived. The Mondeau is the most extensively developed of a number of claims located on a heavily-mineralized dike, and the results of further operations are awaited with much interest by others in the neighborhood.

Cobalt.—Owing mainly to the bonus system based on the market price of silver, the labor situation here is satisfactory, workers being plentiful and the relations between employers and employees harmonious. The daily bonus above the regular wage is now $1.25, and the mines are operated efficiently.

A dispute has arisen over the location of the boundary-line between the Nipissing and the Violet property of La Rose Consolidated, an area of some 56 ft. in width including some of the workings of the Violet being claimed by both companies. Surveyors have been employed and a close examination of the ground made.

The winze being put down on the Ophir by the Mining Corporation has cut the Keewatin-diabase contact at a depth of 141 ft., or a total depth from the surface of 580 ft. Development will be carried on at the contact. The Mining Corporation is installing machinery on its recently acquired property at North Cobalt, where it will sink the shaft to the 300-ft. level.

At the Temiskaming a 9-in. vein carrying considerable silver has been cut at the 400-ft. level.

The Adanac is driving on a new vein at the 310-ft. level, where there is 9 in. of cobalt, niccolite, and ruby silver.

Elk Lake.—Production is going forward steadily at the Miller Lake-O'Brien, and it is expected that the output for the current year will be about $1,000,000 in value. Ore-reserves are unofficially estimated as containing 6,000,000 oz. An examination is being made of the Lucky Godfrey with a view to purchase by interests connected with the O'Brien Mining Company.

Gowganda.—The shaft on the Castle property, which is being developed under option by the Trethewey of Cobalt, is nearing the 300-ft. level where a vein formation has dipped into the shaft.

The Crown Reserve of Cobalt has relinquished the option held on the Walsh property, as it was considered that the result of operations did not justify so large a payment as $300,000.

The Clevenger Prophet is being developed by men in charge of Kirby Thomas. The shaft is down 300 ft., and lateral work is being done on the 200-ft. level with encouraging results.

Kirkland Lake.—The report of the Lake Shore for September marks a new high record with a production of $44,500 from the treatment of 1860 tons of ore, equal to $23.92 per ton. The mill worked 96.21% of the possible time.

At the Dominion-Kirkland a 5-ft. quartz vein has been opened. Test samples yield high assays.

The Wright-Hargreaves is arranging for the erection of its new 150-ton mill on the shore of Kirkland lake, north of No. 3 shaft. Considerable difficulty is being experienced in getting labor for the construction of the plant. The underground workings have been carried to a depth of 400 feet.

Porcupine.—The expectation that Government assistance will shortly be given to the gold-mining industry is encouraged by the receipt of a communication from the British government by Thomas W. Gibson, provincial deputy Minister of Mines, asking for information as to the cost of production at the gold mines of Ontario. The matter is being taken up with the officials of the companies, and some measure of relief from the Imperial government is anticipated. Meanwhile, though many of the smaller mines have been closed, production is being kept fairly up to the mark by those remaining in operation.

The annual report of the McIntyre for the year ended June 30, 1918, is of a highly satisfactory character, showing a production of $1,793,197 from the treatment of 178,327 tons of ore. The average value was $10.05 per ton, and the operating cost $5.14 per ton. The total profits were $811,571, of which $680,361 was transferred to surplus account. The estimated value of reserves was $4,490,432. At the annual meeting the shareholders approved the by-law authorizing the directors to acquire the Plenaurum property, on which the company now holds an option.

The second shaft of the Davidson, which is nearing the orebody indicated by diamond-drilling, has cut a rich stringer below the 450-ft. level, believed to be a lead from the main orebody. Assays taken from the drill-cores showed $24 at the 550-ft. level, and $27 at the 650-ft. level.

MEXICO

Chihuahua

Chihuahua.—An American Consular Report of October 9 states that due to the present high price of manganese ore ($18 U. S. currency per ton f.o.b. Chihuahua) much interest is being taken in the location of claims and in exporting manganese to the United States. More than 50 claims have been registered at the local mining office of the Federal government during the last three months. These claims are in the immediate vicinity of Chihuahua, along the railroad south-east of Chihuahua as far as Ortiz, and west of Chihuahua along the North West Railroad of Mexico. The first shipments were made in September 1917, and at present 350 tons is being exported monthly to the United States. The manganese shipped averages 40%, some as high as 48% Mn. In this city there are several brokers engaged in purchasing manganese ores and shipping them to the United States. A large number of men, having burros, are now earning a living by hauling manganese from the mines to the nearest railroad point.

Mexico

Mexico City.—The Mexican government has rescinded the decree requiring mining companies to return gold to the extent of 25% of the value of silver ore exported from Mexico. Officials say that the oil question will be satisfactorily settled within the next few weeks.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

James W. Neill is at Bingham.

F. W. Bradley has returned from Juneau.

J. L. M. Creede of Tucson is at the Bellevue hotel.

Glenn A. Wallerstedt has joined the Marine Corps.

R. B. Robertson and **John D. Barnes** of Butte are in San Francisco.

W. E. Thorne is on his way to Nigeria, by way of New York and London.

Jackson A. Pearce has left Berkeley on a visit to the Joplin district, Missouri.

J. A. Willey has been made Captain of Engineers, and is at Jamestown, North Dakota.

H. A. Chapman, recently at Telluride, as engineer to the Liberty Bell Mining Co., is here.

Ernest Gayford, of the General Engineering Co., Salt Lake City, has gone to New York.

Cecil Fitch, superintendent of the Chief Consolidated at Eureka, Utah, is recovering from an attack of influenza.

M. Robert Guggenheim, holding the rank of Major, has returned to New York after a year spent in France.

P. G. Beckett has been granted leave of absence by the Phelps Dodge Corporation in order to enter the Army.

Willet G. Miller has been appointed a member of the Committee of the Gold Producers of the Empire in London.

J. Power Hutchins, who has been visiting the copper districts of Arizona, is expected in San Francisco this week.

A. R. Whitman, formerly at Cobalt, has become instructor in topography to the S. A. T. C. at Columbia University.

James F. Kemp has gone from Bingham to Oregon, whence he will proceed to Butte before returning to New York.

G. D. Kislingbury, son of George Kislingbury of Los Angeles, is manager of a tungsten mine at Hereford, Arizona.

W. Shellshear has returned from the Burma Mines, in the Northern Shan States, to the Broken Hill Proprietary, in Australia.

C. A. Botsford has left Crested Butte, Colorado, to become general manager for the Mogollon Mines Co., at Mogollon, New Mexico.

Pierre de P. Ricketts announces that Ricketts & Company have moved their office from 80 Maiden Lane to 280 Madison avenue, New York.

Rush T. Sill of the firm of Sill & Sill, has received a commission as Captain of Engineers and is reporting to Fort Douglas for training.

J. B. Tyrrell has recently visited the Bourkes and Miller-Independence mines and gold prospects in the Matachewan district, in northern Ontario.

Murray Coleman has resigned his position as assistant superintendent for the Atolia Mining Co. to become manager for the C. Fabre Brandt mines in Japan; he sailed for the Orient on November 8.

Bennett R. Bates has resigned as general superintendent for the Cubo Mining & Milling Co. at Guanajuato, Mexico, to accept a commission as First Lieutenant in the 403rd Engineers. **R. R. Leslie** succeeds him.

B. L. Cunningham has resigned as assistant geologist to the Southern Pacific Co., and has accepted the position of consulting geologist for the Doheny Pacific Petroleum Co., with offices at 1011 Security Bdg., Los Angeles.

W. C. Browne, superintendent of the Prince Consolidated mine, has resigned, to enlist in the Officers Training Corps. He has been with the company for eleven years and superintendent for two years. **J. H. Hedges** succeeds him.

Mark Walker has accepted the chair of Professor of Chemistry in the University of Redlands, to which he will give a portion of his time. He will continue his former business of consulting chemical and metallurgical engineer, assayer, and chemist.

Edward E. Bugbee, Professor in the Mining Department of the Massachusetts Institute of Technology, has been granted a leave of absence to accept the position of Assistant Director of Education for the S. A. T. C. in five Southern States, with headquarters at Raleigh, North Carolina.

E. M. Norris, for the past six years foreman of the Tramway mine, has been appointed assistant general superintendent of mines for the Anaconda Copper Mining Co. under **John Gillie**. This was the position held recently by **C. L. Berrien**, now a Major in the Aviation Department in France.

A. G. Langley, Provincial Resident Mining Engineer, with headquarters at Revelstoke, B. C., has been appointed to represent the Provincial Government at the pending inquiry into the rates charged by the Consolidated Mining & Smelting Co. for the treatment of custom ores at the Trail smelter.

Obituary

Thomas Stacey, formerly manager of the Dromedary Hump Con. Mines Co., at Fairview, Nevada, died recently. **Edward W. Stratton** succeeds him.

Howard S. Lee, manager of the Leadville Unit of the U. S. S. R. & E. Co., until it was closed in August, died from an attack of influenza on October 22. He contracted the disease at Silverton and died at Denver.

C. A. Waring, geologist on the staff of the State Mining Bureau, died at his home in San Francisco on November 4 from pneumonia following an attack of Spanish influenza. He graduated from Stanford University in 1911. His death is deeply regretted by his many friends among those engaged in mining in California.

Myron H. Peck, Captain in the Second Engineers, A. E. F., was killed in action in France on October 9. He received his technical training at the University of California, graduating in 1897. For several years he was professor of civil engineering at the Imperial University at Pekin. He returned to the United States in 1910 and engaged in various engineering work, including jetty construction at the mouth of the Columbia river and the improvement of the channel at Mare Island. For several years he maintained offices in San Francisco. He was commissioned Second Lieutenant of engineers in the National Guard of California in 1916 and saw service on the Mexican border. Later he entered the Engineer Officers Reserve Corps and was assigned to Camp Lee, in Virginia. From there he sailed for France early in January of this year. He is survived by a wife and two children.

The U. S. Civil Service Commission announces that examinations will be held in San Francisco at an early date for petroleum technologist, at a salary from $2500 to $3000, also for a vacancy in the U. S. Bureau of Mines at Washington.

THE METAL MARKET

METAL PRICES

San Francisco, November 12

Aluminum-dust, large and small lots, cents per lb.	65—70
Antimony (wholesale), cents per pound	13.00
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	8.30—8.80
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb.	$120
Spelter, cents per pound	11.00
Zinc-dust, cents per pound	16.00

ORE PRICES

November 12

Chrome, no definite quotations available.

Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% MoS_2	$1.25
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, per unit	$20—$26

EASTERN METAL MARKET

(By wire from New York)

November 12.—Copper and lead are unchanged. Spelter is quiet and easy.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government has fixed its maximum at 49½ pence.

Samuel Montagu & Co. of London, writing on October 24, stated that for a long time past, the tendency of the silver market has been described as good. A new factor has now to be taken into consideration, namely, the present cessation of Indian remittances, owing to the unsatisfactory character of the monsoon; but it is not likely to have an important effect upon the general need for silver. There is always the possibility of a small reduction in the maximum London price in order to correspond with a possible lessened charge for insurance on supplies sent to this country from America.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, which have since been extended to January 1, 1919, prices to be effective on the day of shipment, not the day of sale. Quotations in cents per pound are as under:

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefore $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

ORES (New York)

Antimony: No reports of any business.

Ferro-silicon: It is understood that those producers of 10 to 12% ferro-silicon in electric furnaces, who have been obtaining from $75 to $85 per ton, will have to submit to fixed prices, silimar to the price for the blast-furnace products of like composition.

Manganese Alloys: Steps have already been taken to cut down the output of ferro-manganese and spiegeleisen by putting blast-furnaces on pig-iron. Already several furnaces have either gone on to pig-iron or have been ordered to do so. The movement is the result of the advice and request of the War Industries Board. It was not unexpected, as the output of ferro-manganese was about 26,000 tons in September and of spiegeleisen about 40,000 tons, according to the blast-furnace reports of 'The Iron Age.'

Molybdenum: Demand is light, with the market dull and nominal at previous quotations.

Tungsten: Peace developments and the election holiday put a curb on any desire to do any more business than necessary. As a result, the market has been quiet, only a few lots of high-grade ore having been sold. Prices are unchanged and nominal at $20 to $26 per unit, depending on the purity of the ore. The last quotation on ferro-tungsten was $2.55 per lb. of contained tungsten, but no test of the market is reported. It is believed the alloy can be bought under this level.

Eastern Metal Market

New York, November 6.

Where the markets are under no control there is an absence of demand, and in others conditions remain unchanged and featureless.

With the price of copper fixed to January 1 it is only a matter of supply to meet the large war demand.

The tin market is rapidly adjusting itself to Government and International control.

The lead situation is entirely unchanged and under rigid control.

The zinc market is lifeless, demand being very light; prices have hardly changed.

Antimony has undergone a marked decline.

The principal question in the steel industry is how fast war demand for iron and steel will now fall off. The moves made this week in the reduction of munitions and ordnance orders are of considerable significance with peace more probable than ever. A revision of the plans for the big Neville Island gun plant is said to be under way, while it seems quite certain that work will not go forward on the 12-in. howitzer plant to have been erected by the Midvale works at Philadelphia. Considerable shell-steel is still on the Allies' books, and the first cancellation will probably come from them. The October pig-iron output was cut down by influenza, and the expected record could not be made. The output was 3,486,941 tons or 112,482 tons per day, against 3,418,270 tons for 30 days in September, or 113,942 tons per day, according to 'The Iron Age'. The October record was only once before exceeded previous to September, and that was in October 1916, with 113,189 tons per day.

COPPER

It has been pointed out that the world's production of copper has expanded 40% in the last five years. This has been done not by an increased number or a more efficient set of men, but by the use of men who have been engaged in development and construction work. This fact of larger output will have an important influence in determining the fate of the copper market when normal times return. It is probable that the present price of 26c. per lb. will rule until the War ends, if it does not end before January 1, the date set for the expiration of this price. Whether Government control will obtain after peace comes is another factor. Some think that when an open market again rules prices will not go above 26c., no matter what the demand may be, citing the fact that before the War the highest price had been 12 to 15c. per lb. Output of refined copper is lagging, due largely to influenza. When operating at capacity the refineries can turn out 250,000,000 lb. per month; lately their production has been from 170,000,000 to 200,000,000 lb. per month.

TIN

Official announcement has appeared in the past week from the Tin Section of the War Industries Board over the signature of George Armsby, chief of the section, that the tin trade is under the control of the International Tin Executive, sitting in London, and that so far as the United States is concerned all licenses for importation will be granted only to the U. S. Steel Products Co., which will deliver the tin through the American Iron and Steel Institute at cost to consumers. Details of the plan are lengthy, and have appeared in the public press. It is plain that the old importers, who have conducted this vast and important business for so many years, are out of business for the period of the War. If this control will obtain after the War is difficult to say. It is also officially stated that licenses will be issued to such importers for the filling of all contracts entered into prior to October 1, so that this part of the program will go on as under the old régime. The Tin Importers' Association, Inc., recently formed in New York, has just issued a set of resolutions which it has sent to the War Industries Board and to the trade. After reviewing the steps that have led up to the present system of control, and after stating that the decision to regulate the trade was made without consulting the tin trade as a whole, as had been done in other similar situations, it terms the present plan as a virtual monopoly by the largest consumers of tin in the country and protests against the continuance of such a plan. It asks to be heard by the Board, and offers to suggest other methods of controlling the trade that it believes to be more just to all concerned. There has been the usual small trade in the last week in tin en route or to arrive by those desiring to get rid of the metal before a price is fixed, concerning which no official word has yet come out. Such sales have been made at about 75c., New York, which is the nominal quotation for spot metal. These transactions have not aggregated over 500 tons, it is believed. Tin arrivals in October were 3575 tons through Pacific ports and 685 tons through Atlantic ports, a total of 4260 tons. There was also 190 tons in stocks and landing on October 31. The London market is unchanged at £344 per ton for spot Straits.

LEAD

There is no change to report in the situation, conditions as to distribution and prices being under strict control, with the Lead Producers' Committee giving entire satisfaction. It is understood that the output for the remainder of the year has been oversold, and that there is little prospect of any relief as to extra supplies. Prices remain fixed by agreement at 7.75c., St. Louis, or 8.05c., New York.

ZINC

The market is absolutely lifeless and is indirectly marking time, awaiting international developments. Demand is light from both consumers and dealers, but quotations are unchanged today from those of a week ago at nominally 8.60c., St. Louis, or 8.95c., New York, for prime Western for early delivery. For prompt the quotation is 8.65c., St. Louis, or 9c., New York. Late last week this price stiffened a little to 9.10c., New York; or 8.75c., St. Louis, on a fair demand, strengthening also the early delivery market slightly to 8.65c., St. Louis, or 9c., New York. For first quarter the quotation ranges from 8 to 8.12½c., St. Louis, or 8.35 to 8.47½c., New York, with most dealers asking the higher price. December delivery is quoted nominal at 8.37½c., St. Louis, or 8.72½c., New York. Both output and stocks have decreased in the week ended October 26, according to the Government weekly report, the former about 800 tons and the latter about 2400 tons, making a strong statistical position.

ANTIMONY

Demoralization seems to have hit this market, which, on light demand and eagerness to sell, has fallen to 10.50c., New York, duty paid, nominal, for wholesale lots. Prospects of peace are evidently not regarded as a bullish factor.

ALUMINUM

The market is under Government control at 33c. per lb. for 50-ton lots, at 33.10c. per lb. for 15 to 50-ton lots, and at 33.20c. per lb. for 1 to 15-ton lots. These quotations apply to No. 1 virgin metal and to scrap only.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

CONVEYORS REPLACE COMMON LABOR

Nowhere in the industrial fabric has the disturbance brought on by war conditions been more keenly felt than in the unskilled labor market—among the shovelers, lifters, and movers of goods and materials.

This situation aroused great interest in light, portable material-handling machines. It became an established principle with many companies not only to replace labor by machinery whenever the machine could do the work cheaper,

LOADING COKE-CARS BY MEANS OF A PORTABLE BELT-CONVEYOR.

but to prefer the machine if the costs were the same or even slightly higher.

Light, strong, well-designed portable conveyors, economical of power, easily moved about and set up, made their appearance. They are adapted to handling coal, sand, gravel, ashes, salt, chemicals, package goods, brick and stone. They

USING A CONVEYOR TO LOAD A RAILROAD-CAR.

were designed and built in standardized sections that could be assembled in units of any length to meet any requirements. This made it practical to carry at factory for prompt shipments a large stock—and held down the investment tied up in such a stock to reasonable proportions. These conveyors in hundreds of businesses have proved their ability to reduce handling costs from 50 to 90%. Single units have replaced from 3 to 20 men. They were so badly needed that they have paid for themselves, in many cases, in less than a month.

Such portable belt-conveyors elevate as well as move material and so have made it possible to use more fully the storage space available. Without additional cost, material can be piled to the top of a warehouse or a coal-shed—and on the open ground, higher and more compact piling of material is possible. Additional construction of storage buildings can in this way often be avoided. In the service of the Western United Gas & Electric Co. at its plant in Joliet, Illinois, two B-G portable belt-conveyors made by the Barber-Greene Co. of Aurora, Illinois, are operated in series in loading coke into railway cars. These cars are loaded in from two to four hours, according to size and type, with less than half the labor that was previously required to load them in from 7 to 10 hours. The saving in cost is about 50%. This is typical of results secured by use of these conveyors in many places.

Several types of conveyors have been worked out to meet different requirements by the Barber-Greene Co. For elevating at angles under 25° a plain belt is employed. For angles of 30 to 35° a belt equipped with steel flights is provided to prevent the material slipping down the grade. For chemicals that will corrode, metal conveyors of similar design are provided with wooden frames. The conveyors are made portable by mounting them on a wheeled truck or suspending them from a trolley attached to an overhead steel cable.

A wide variety of applications have been worked out since these conveyors went into use—many of them unforeseen until they were discovered in practical use. They unload cars into piles, into storage sheds, into wagons or motor-trucks. They load cars from trucks or wagons, storage piles, or sheds. Where the carry is longer, two or more conveyors can be worked in combination—sometimes with a chute between them. A careful study has been made of piling systems and methods developed by which the largest tonnage can be stored on a given amount of surface. A few methods of applying the conveyor are illustrated in the accompanying illustrations.

MAKING BLACK BLASTING POWDER

By W. J. Cahalan

Black blasting powders are divided into two main classes —'A' blasting and 'B' blasting. The methods of manufacturing both are practically identical, the difference being in the ingredients used.

Composition of 'A' blasting is about 75% saltpetre or nitrate of potash, 15% charcoal, and 10% sulphur. It is somewhat stronger and quicker in action than 'B' and is less liable to deteriorate with age or exposure to the elements on account of the fact that saltpetre is practically non-hygroscopic, while nitrate of soda which is used in the manufacture of 'B' is more hygroscopic. The 'A' grade is also more expensive than 'B' grade, due to the high cost of saltpetre as compared to the cost of nitrate of soda.

Nearly all the saltpetre used in this country for some years previous to the beginning of the world war was made from nitrate of soda, imported from Chile, and muriate of potash, imported from Germany; practically the entire commercial supply of potash for the whole world was obtained from the mines at Stassfurt, in the Prussian province of Saxony. Previous to that it was imported from India. Since the beginning of the present war considerable amounts have been obtained from the same source, but as the supply is

controlled by the British government, the East India saltpetre imported since the beginning of the War had to be used in the manufacture of powder for military use exclusively. The Du Pont company has succeeded in producing a limited quantity of saltpetre independent of the above sources by refining Chilean nitrate of soda containing a high percentage of potash.

'B' blasting powder is composed of about 75% nitrate of soda, 15% charcoal, and 10% of sulphur. Nearly all the black blasting that is used at the present time consists of 'B'.

In the manufacture of black powder the saltpetre or nitrate of soda is first reduced to fine particles in what is called a 'beater', consisting of an iron cylinder containing beaters or paddles which revolve at a high rate of speed, beating the material between the paddles and the outer edge of the cylinder. The charcoal and brimstone are weighed and mixed in proper proportions and charged into large iron cylinders containing iron balls, the cylinders are then set in motion, and the action of the iron balls pounding against the ingredients pulverize them into very fine particles. This operation also serves to thoroughly mix these two ingredients and make what is termed 'pulverized dust'.

The next step is to weigh the prepared ingredients in proper proportions, in bags, and transport same to the incorporating mills, commonly called 'wheel mills'. This is where the ingredients first become powder or explosive.

A wheel mill is a mortar and pestle on a large scale. The mortar consists of an iron bed plate about 10 ft. diam. with flaring wooden staves, which form a tub or pan, and the pestle consists of two iron wheels about 6 ft. in diam. and 20 in. face, weighing around 10 tons, which revolve on the ingredients after they are placed in the pan. Wheels are preceded by plows which throw ingredients both from the outer edge and centre of pan toward the middle of the faces of the wheels, and the ingredients are thus thoroughly incorporated and make what is known as 'wheel cake'.

The wheel cake is taken to a press mill, of hydraulic type, assembled in a horizontal position. The box in which the powder is pressed is constructed of hard wood and is about 2 ft. square and 10 ft. long. Aluminum plates are placed in the press box in a vertical position, and are held by slats of wood fastened to a header, or 'finger-boards'. The powder is shoveled into the box, falling between the aluminum plates, and when the box is filled, the finger-boards are removed, hydraulic pressure applied, and the powder is pressed into cakes about 1 in. thick and 2 ft. square.

The press cakes are transported to the corning mill, where they are cut up into grains of the desired size by being passed between pairs of zinc rolls, the size of the grains being governed by the distance which the rolls are set apart. Screens are installed beneath the rolls for the separation of the useful grains from the dust.

The grains are taken from the corning mill to the glazing or finishing mill, where they are dried and polished in large revolving barrels. A small amount of graphite is added for the polishing of the grains, the purpose of which is to make them more resistant to moisture.

After the powder is dried and polished it is taken to the packing-house, where it is separated in an oscillating separator into the different sized grains desired. The separator is fitted with screens of the proper perforation.

The combustion of black powder is controlled by the sizes of the grains—the larger the grains the slower the powder burns and the smaller the grains the faster it will burn. To assist in the regular combustion of each granulation a great deal of attention is given toward insuring an even density of the powder; this is controlled in the pressing process.

Black powder has been made and used for centuries, and up until a few years ago was the only kind of powder made, and while it has been replaced for many uses by high explosives, it is still in great demand. More of it was used in the United States in 1917 than in any previous year, as nothing has been found to equal it for the economical mining of coal, blasting of slate, blasting of stone, where it is desirable to get out large unbroken pieces, or in earth blasting, where it is desired to move a mass of earth bodily, and where there can be no danger of igniting dust, gas, or firedamp.

FASTENING WIRE-CABLE ENDS TO SOCKETS

Many riggers who have experienced difficulty in making a satisfactory joint when placing a forged socket on the end of a wire cable will doubtless be interested in a new method developed by John T. Willison of Ambridge, Pennsylvania. Mr. Willison, who was testing 19-strand cables for tensile strength, was particularly interested in making a joint which would be stronger than the cable itself. After trying several methods unsuccessfully, the joint failing in each case before the cable was loaded to capacity, he finally conceived the idea of securing the cable in the socket with Smooth-On iron cement in the way illustrated by the sketches. The cable end was first passed into the socket as

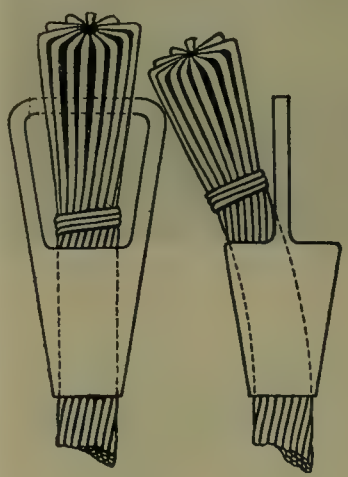

FIG. 1.

FIG. 2.

illustrated in Fig. 1. One of the outside wires was untwisted and wrapped tightly around the others. Above this wrap the remaining wires were untwisted and belled out as shown and the ends turned down. Smooth-On iron cement No. 1 was mixed with water to a smooth putty-like consistence and the socket packed closely with it. The cable was then pulled firmly into place and the cement allowed to metallize. In metallizing, the Smooth-On iron cement expanded sufficiently to completely fill the spaces between the wires and between the cable and the socket shell and to wedge the joint securely. A firm union resulted which, on test, proved to be stronger than the cable itself.

Garfield Myers has been granted a legal change of name by the Superior Court, and will hereafter be known to his business friends and associates as C. A. Garfield, and the firm name of Garfield Myers & Co. will hereafter be known as **Garfield & Company.** There is no change in the personnel of the organization, or in the lines of construction machinery and equipment they handle.

The Chicago Pneumatic Tool Co. announces the election of H. D. Megary to the office of secretary, vice W. B. Seelig, resigned.

Correction of an Error

In our advertisement in the September 14th issue of the "Mining and Scientific Press," we inadvertently published what now appears to be an error concerning the "approximate weight" of liners used in "any other type of 8-ft. mill", as compared with those used in the 8-ft. Hardinge mills.

As figures have been shown us in at least one instance, indicating that we are in error, we therefore, gladly publish this (paid for) retraction of our statement. Our advertisement also made mention that a crane was required to handle the 8-ft. cylindrical ball mill linings. This broad statement is likewise an inadvertent error on our part due to the hasty wording of our analysis of Mr. Kennard's paper published in the A. I. M. E. Bulletin.

The Hardinge Conical Mill Company has never intentionally published an erroneous statement, and it is far from our desire ever to appear to do so. We will carefully reread some of our other past Ads, and if we note any errors will publicly correct same.

HARDINGE CONICAL MILL CO.

Adverting to the above an error was also made in another advertisement when we stated that—

HARDINGE MILLS
—AT—
NEVADA CONSOLIDATED

ran over one year without relining. The actual running time was slightly over 11 months, or to be exact—

7973¼ Hours
WITHOUT RELINING
(349.8 Tons Per Day)

CAST IRON LINING CONSUMPTION—approximating				**2**	**oz. PER TON**	
"	**STEEL** "	"	"	**½**	"	"
"	**IRON BALL**	"	"	**1 44/100 lbs.**	"	"

The above figures are from an analysis of the paper by Mr. George C. Riser, Supt. Nevada Consolidated Concentrator, read before a meeting of the American Institute of Mining Engineers.

We will be pleased to send you a copy of the paper upon request. It contains details of crushing—unbiased—technical and non-commercial.

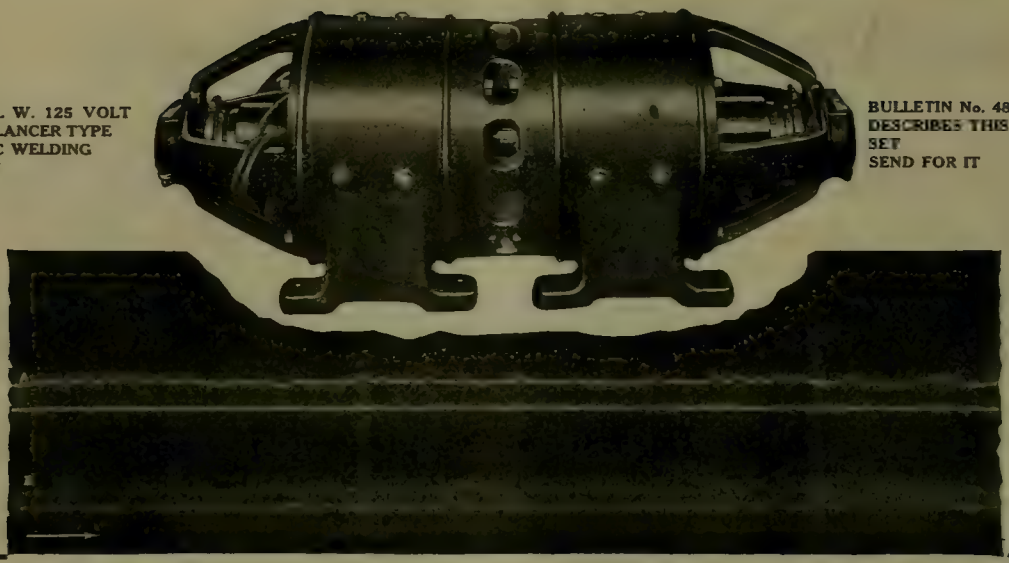
3 K. W. 125 VOLT BALANCER TYPE ARC WELDING SET



BULLETIN No. 48940 DESCRIBES THIS SET SEND FOR IT

Oscillograph curve, showing electrical conditions in welding circuit of constant energy arc welding equipment.
Curve "A" shows current in arc, approximate average value 150 amps.
Curve "B" shows voltage across arc, approximate average value 15 volts.

Steady flow of metal assured by efficient and simple G-E Welders

G-E constant energy arc welding sets are used to secure a steady flow of metal into the weld and high operating efficiency.

A constant flow of metal is assured by the inherent automatic regulation of the energy in the welding circuit throughout the welding range for metal electrodes.

The distribution of welding current between the two units comprising the set and practically dispensing with external resistance in series with arc, assures high efficiency.

One small panel and the set illustrated are all the equipment needed for a one-man outfit where operator has mask and electrode with flexible cable—if 125 volt direct current is available.

Consistently perfect welds are being produced in essential war industries by the use of this equipment.

We are prepared to demonstrate these sets and make good deliveries

CANADIAN casualties are given officially as 311,358, of whom 34,877 were killed in action and 15,457 died of wounds or disease. We salute our good neighbors on the north and congratulate them most respectfully on their splendid service to the great cause.

ONE of our advertising pages is given gratuitously to the propaganda of the Y. M. C. A., which pre-eminently useful organization will have much to do in Europe despite the cessation of fighting. Truck-drivers and automobile mechanics are needed. Read the advertisement.

SETTLEMENT of the litigation between the American Smelting & Refining Company and the Bunker Hill & Sullivan Mining Company is announced solemnly by the 'Boston News Bureau'. This might refer to some new litigation of which we had not heard, but, on inquiry, we find that it refers to the litigation that was settled by compromise, mutually satisfactory, on March 1, as duly recorded in these pages at the time.

EMPLOYERS of labor, more particularly our friends the managers of mines, mills, and smelters, will, we presume, not hesitate to restore technical men that have been in the Army or Navy to the positions that they resigned when they entered the National service. There should be no delay or excuse of any kind for effecting this restoration, even at the temporary expense of the substitutes. The man that answered the call of patriotic duty merits the first consideration.

HINDENBURG is reported to have issued a proclamation in which he asserted that the German army finished their fight with "heads proudly erect." This only proves how little he realizes that, in the eyes of the world at large, he and his army have been dishonored by their campaign of frightfulness. They fought bravely and tenaciously, but they lost the honor that might have been left them in defeat by having used methods worthy of savages. Their honor is forever besmirched by their dirty doings.

CESSATION of hostilities has not caused a violent slump in the stock market. The memory of the panic that occurred when the war began in Europe had led many to fear that the abrupt readjustment to peaceful conditions would be disastrous to share quotations on Wall Street. The cancellation of contracts with the makers of munitions has depressed the 'War babies', naturally, but this decline in prices has not affected the peace stocks, which are steady, if not buoyant. This suggests a quiet return to normal financial conditions.

BRIEY has been re-occupied and the whole of the Longwy-Briey iron district is again in the hands of the French. Our readers will rejoice at the news, for they know how essential these deposits of iron ore are to the industries of France. Still better, with the hoisting of the tricolor in Lorraine the French regain the extension of these deposits into the old province and will re-possess a splendid industrial asset. As we have stated before, the winning of Lorraine should increase the French production of iron ore to 43,000,000 tons and decrease that of Germany to 7,500,000 tons per annum.

MOCK heroics should not be allowed to influence the choice of a punishment for William of Hohenzollern. The talk of St. Helena strikes a false note. When Napoleon was conquered he retired into exile with the respect of all soldiers and of most civilians for the way in which he had fought; he retained the loyalty of his own people and received the honors due to a great enemy from those that had fought him so long. The Kaiser's picture will fit no such gilded frame. If he and his six sons had shown military capacity and had risked their lives in battle, they would seem less despicable today. The late Kaiser is a criminal at the bar of justice, not a hero for an international cinema.

VARIOUS rumors are current concerning the steps to be taken to protect the production of gold. It is said that the Chamber of Mines in the Transvaal has suggested that the British government contract to buy all the gold produced on the Rand during the next ten years at an advance of 10 shillings, or $2.50, per ounce upon the price hitherto established. The London Chamber of Commerce recently passed a resolution stating that the production of gold was an essential war industry and ought to receive preferential treatment by the Government. It is too early to detect the effect of peace on the status of gold, because, although active warfare has ceased, the enemy countries are not yet in a position to

trade with the rest of the world, and until trade relations are established afresh we shall not know to what extent they will involve an increased use of gold.

PRICES of metals will undergo some measure of readjustment now that hostilities in Europe have ended and the demand for munitions has ceased abruptly. We understand that 450,000,000 pounds of copper is in transit and unmarketed, the largeness of the quantity being due to the shortage of capacity at the refineries, the general shortage of labor, and the crippling effects of the influenza epidemic. The producers of copper have suggested to the Government that it should buy all this floating supply of copper at the official price and then leave the market open to business without any further attempt at regulating prices. As to lead, it is interesting to note that a shipment of 500 tons of lead from the Bunker Hill smelter, in Idaho, to the Union Iron Works, in San Francisco, was countermanded by the Government while on its way hither on the day that the armistice was signed. The floating supply of lead is small and the market conditions are believed to be healthy.

IT is reported that when the terms of capitulation were read by Marshal Foch to the German delegation, one of them, Dr. Mathias Erzberger, said: "Marshal, have you any sympathy for the German populations?" This same delegate, it is stated, sobbed when he signed the protocol. We would have liked to have taken him to certain parts of Belgium, say, Dinant, Louvain, or Termonde, and then to parts of evacuated France, then to Serbia, and we would have asked him to sob again. The Germans are in a sorry plight and now that they are thoroughly beaten, the Allies will be humane enough to aid in preventing famine within their disordered country, but it is in no spirit of vindictiveness, but of bare justice, that we remind them, in their dark hour, of the misery that they brought on innocent civilian populations during four long years when they imagined themselves able to over-ride all sentiments of humanity.

ON his departure for Europe, Mr. Hoover takes with him the continued good wishes of the profession. His work as Food Administrator has won general public support and commendation, which is fully confirmed by the results achieved. It will not be long before the Food Administration at Washington will cease to exist, transferring its surviving duties to the Department of Agriculture, therefore the President has asked Mr. Hoover to go to Europe, where an organization for alimentation on a large scale will be required at once. As Mr. Ralph P. Merritt, the efficient Food Commissioner for California, has said recently: "The call of humanity is more insistent in the hour of victory than before the war began." It will be a keen pleasure to Mr. Hoover to revisit Belgium and see for himself the beneficent results of his own initiative in 1914, but now he will widen his sympathy and enlarge the scope of his work so as to cover many other countries, even those with which we have just been at war and with which technically we are at war still. The mining profession unites in wishing him god-speed and in hoping that he may retain the good health required to perform his colossal task.

NON-PARTISAN citizens, we believe, have accepted the result of our recent khaki election with satisfaction, because a Congress so closely divided between the two parties will prevent the passing of any legislation that does not commend itself to the good sense of the country as a whole. As we interpret the election, it was not so much a rebuke to the President for his political manifesto as to the volunteer regulators by whom the President has been surrounded during the last two years. The people of the United States are easily irritated by any suggestion of autocratic methods. We are glad that Mr. Ford "expects to resume the manufacture of pleasure-cars as fast as he is released from war contracts," because that enterprising gentleman is so much better fitted for making standardized machines of transport than for the duties of a legislator. His lack of the qualities of a statesman, or even a politician, were clearly demonstrated by the peace expedition that he sent to Europe so inopportunely. It is one of the vagaries of human nature to suppose because a man is pre-eminently effective in one branch of human activity that he must also be well qualified for other activities of an entirely different character. This is shown by the choice of admirals, generals, or even bankers, as directors of mining companies. We recall the mining fiascoes connected with the names of Lord Dufferin in London and of Admiral Schley in New York. 'Let the shoemaker stick to his last.' Mr. Ford is more useful at Detroit than at Washington.

Chromite—and Manganese

In our issue of November 9 we published a telegram from Mr. H. W. Sanford, chief of the Ferro-Alloys Section of the Chemicals Division of the War Industries Board, in which he referred to the "misconception in the minds of some chromite purchasers," who had interpreted his telegram of September 27 to mean a guarantee of sale "for the balance of this year and the first half of next year." On September 27 Mr. Sanford telegraphed to Mr. Frederick J. Koster, President of the San Francisco Chamber of Commerce, stating: "It is the present intention of the War Industries Board to arrange for continued chromite production in the United States for the first half of 1919 at a rate proportionate to the rate of 1918 production and the trade will be asked to purchase chromite of suitable grade produced in the United States during the first half of next year at this rate. No announcement can be made regarding prices. Believe tonnage of domestic chromite produced during the balance of this year can be sold at the average prices paid this summer by the California Chrome Company. If unable to find ready market for ore wire this office giving tonnages ready for immediate delivery and guaranteed analysis and prices wanted and to whom already offered

and refused. Chemical refractories and steel trades likely buyers." This telegram afforded ample reason for the belief that a market for chrome was assured for "the balance of this year and the first half of next year," and we do not see that any unwarrantable "misconception" existed in the minds of the producers. The suggestion to "wire this office" for assistance in marketing Californian chromite, provokes a derisive smile, knowing, as we do, the nature of the help given by Mr. Sanford and the Electro-Metallurgical Company to the producers of chrome and manganese on this Coast. Why did he not warn local producers months ago that there were signs of a glutting of the market? Why were the producers kept in the dark concerning the fact that the electro-metallurgical consumers—a small group—had accumulated a supply sufficient for ten months? For what interest did the California Chrome Company, the representative of the same group, act, for patriotism or profiteering? Eight months ago this company made a big splurge and advertised freely its willingness to buy ore for the remainder of the current year at higher prices than had been prevailing. Within four months they had driven all other buyers out of the market and achieved a position such that their manager could brag that he had the producers in the hollow of his hand. Then, having cinched the chrome industry of the Pacific region, the California Chrome Company suddenly ceased buying; they said that the price had not gone down but that they were out of the market, thereby opening the way for others to make lower bids. When an appeal was made to Mr. Sanford, he sent lists of buyers. Many producers tried this list, the result being the sale of one carload and sundry offers of lower prices. Nor have the manganese producers fared much better. The unfavorable schedule prepared by the committee of the Iron & Steel Institute, the same group of ferro-alloy dealers and consumers, Messrs. Price, Lavino, et al., drove a number of miners from the exploitation of manganese to that of chrome. The same antics marked the stimulation and subsequent depression of the manganese industry, which is now in a precarious condition. In all these manœuvres there appears unmistakable evidence of a purpose: to kill any industry on the Pacific Coast that would interfere with the control of the electro-metallurgical group at Niagara. Quite recently Mr. C. M. Weld, a representative of the Bureau of Mines, has been placed on the ferro-alloys committee. This is an example of shutting the stable when the horse has gone; it ought to have been done long ago; it was a blunder to allow the committee to consist wholly of the representatives of the consumers. The entire affair is a disgrace to the War Industries Board, which has permitted the ferro-alloy group to do much as they liked. It appears to us that the Bureau of Mines has been used as a cat's paw and that the Administration has been discredited. It should be clear to any fair-minded man that a moral equity exists as between the Government and the producers of chrome ore. It is true, the War Minerals Bill does not provide for this exigency, for it is not retroactive and it only applies to a scarcity of minerals, not to an unfortunate position created by an over-supply. This, however, should not debar the President from acting in the matter; he has an emergency fund, now something like $50,000,000, out of which he could reimburse the chrome producers for their losses, amounting to about $1,500,000.

As we go to press we learn by telegram from Washington that the President, by executive order, has placed the War Minerals administration in the hands of the Bureau of Mines, where it rightly belongs. Consumers are still trying to break through the order prohibiting imports of cheap chromite from New Caledonia. It is estimated that the consumption is 95,000 tons and the domestic production 75,000 tons per annum, so that there is no excess of domestic ore. Stocks are said to be not excessive considering the plans of the Government for sustaining industries. No shipping is available for importing minerals, and restrictions on automobile manufacture have been removed, thereby re-establishing an important channel of consumption. The demand for chrome is likely to be larger next year and under the War Minerals Act the purchases by the Government can be protected by duty; in short, conditions favor the absorption of the American production if the War Minerals Act is administered firmly, as we may now expect. We hope to publish further information at an early date.

The Terms of Capitulation

On November 12, the day after the armistice was signed, Dr. W. S. Solf, the Secretary for Foreign Affairs at Berlin, sent a message asking the President to intervene for the purpose of mitigating the harshness of the terms that the representatives of Germany had been compelled, by force of circumstances, to accept. With his sophisticated argument we have nothing to do, nor need we inquire into the motive prompting this appeal to one of the belligerents instead of making it to the chief of the Allied forces, but it may be well to consider the terms of the armistice in the light of expressions of opinion made publicly by various leaders of the German people at the time when they thought themselves likely soon to be in the position of formulating terms as victors to the vanquished. The former Financial Secretary, Herr Helfferich, speaking in the Reichstag, said: "We have financed this war on the presumption of winning it and that the indemnities to be exacted from our defeated enemies would fully reimburse us and defray the expenses thereof, and that they, the conquered nations—not we—would drag around or carry on their shoulders the burden of the leaden billions." This, of course, is in harmony with the ideas expressed by Bernhardi and other German writers before the War, all of whom made it clear that the cost to the German government of subsidizing industry and of promoting the industrial invasion of foreign countries would be reimbursed on the occasion of the next successful war, the victims of which were indicated without compunction. Unfortunately for the Germans their predatory scheme did not work out as

was expected and the burden of defeat now falls upon them instead of being laid upon those whom they so wantonly attacked. Soon after the unrestricted U-boat campaign was started Von Tirpitz said: "I hold the English fleet in the hollow of my hand and will have England on her knees within sixty days. We shall then exact such terms of surrender as will satisfy the Imperial German government. One condition will be that England will deliver to Germany intact her entire fleet, which later will be manned with good German sailors and will sail across the Atlantic to the big, fat, rich cowardly nation, the United States, and she will be compelled to pay the bill." This authentic statement of the head of the German navy should soothe the tender sensibilities of those who are inclined to consider the terms of capitulation too severe. However, we have other trustworthy testimony to the German idea of the terms they thought it would be proper to exact if they won. Dr. Oppenheimer said: "If we win, we must utterly destroy the power of England; we must take her colonies and her fleet. We might take the French fleet, too, and make France bear the cost of the war. Belgium could be joined to Germany." This exponent of kultur had the good sense to preface his fulmination with an 'if', which proved more significant than the rest of his declaration. Count von Reventlow, a publicist whose name has become familiar to most of us during the War, said: "Our statesmen must in the peace negotiations be men of iron and not resemble soft wood painted iron-gray. The German people mean not only to hold out but to conquer." Apparently he and his friends, if placed in the position of Marshal Foch and Admiral Wemyss, would have paid scant attention to any such appeal as that forwarded by Dr. Solf to President Wilson. In the November 'Atlantic,' Mr. P. H. Chadbourn quotes one of his German hosts, a party of explorers at Babylon, as saying: "Mark my word! The next time we go into France we will take it all, I say, to the Channel and to the Mediterranean. But we may give back Paris, perhaps, for to Germanize it would spoil it. . . . Yes, we will draw a circle around Paris, and keep it *tout-à-fait Parisienne*—a place where we can amuse ourselves when our serious work is done." What the nature of that "serious work" would be, we can infer from the experience of Belgium. The dethroned Kaiser, now interned in Holland, told Ambassador Gerard that "America will have to look out after the war; I shall stand no nonsense from America after this war." Again we need not indulge in much guessing as to what might have been the punishment that the Hohenzollern would have visited upon America, whose military resources he so fatally under-estimated. We know what the Germans would have done to the rest of the world if only they had succeeded in their mad onslaught, for do not Russia, Rumania, and Belgium supply the damning proof? They debauched the Russian government, they stole the food of the Russian people, they crushed them to the earth until their very manhood was gone. In Belgium, they levied punitive fines on the cities, they looted private homes, they enslaved the able-bodied men. In France, so long as they occupied a part of it, they perpetrated every conceivable act of systematic brigandage and savagery. What they would have done is recorded in the petitions of their intellectuals to the Government: "It is necessary to impose a mercilessly high war indemnity on France and not forget her colonial possessions." Again: "The security of the Empire in a future war requires the ownership of all mines of iron ore, and to defend them the fortresses of Longwy and Verdun." They intended to evacuate the native populations of the countries they had invaded, perpetrating a crime against which civilization would have protested in vain. In 1916 General Von der Kries said: "This country [Poland] was meant for Germany. We propose to remove the able-bodied Poles, to leave it open to the inflow of Germans as fast as we can spare them. They will occupy and work it. By and by we shall give back Poland, and it will then be automatically a German province." It is no wonder that Nietsche said: "Deep in the nature of this race there lurks unmistakably the beast of prey; the blond beast lustfully raving in search of booty and victory." The "blond beast" has been frustrated and now he whines because he has to take his medicine, a medicine that is intended to be an effective preventive to another fit of "lustful raving in search of booty" at the expense of his neighbors. Out of their mouths let them be judged. Justice is a higher quality than sentimentality. The German need never fear we shall treat him as he would have treated us, but we intend to protect ourselves from the danger of further depredation on his part and we desire to make him see the error of his ways. To Dr. Solf's plea for food, the President replied, through the Secretary of State, that the people of the late German Empire would be supplied with food and their distress relieved by the Allied governments "provided he can be assured that public order is being, and will continue to be, maintained in Germany and that an equitable distribution of food can be clearly guaranteed." And what shall be said of the appeal made by German women to the President's wife? At first it softens one's heart, for any man hates the idea of bringing suffering upon women or children; but Justice places her firm hand on Pity's shoulder and reminds her that the women of Germany treated our prisoners vilely, nor did they raise the slightest protest against the starving of the women and children of Belgium. We have no reason to believe that they would have asked the Kaiser to be gentle if the British navy had been rendered impotent by his submarines or if his gray host had overrun France. The women of Germany do not need Mrs. Wilson's intercession, they will be treated much better than they deserve. The victors in the great contest now ended will do for the vanquished what it is certain the vanquished, if the position had been reversed, would never have done for them. In this, as in other matters, we shall not follow the precepts of kultur but those of civilization. The one is the glorification of national conceit and military rapacity, the other is the emergence from the jungle and the spiritual growth of humanity.

Process for Recovering Platinum

The Editor:

Sir—Mr. V. J. Zachert deserves the thanks of the profession for his interesting article in your issue of October 12, describing his new method of separating platinum from 'black sands'.

I have not had opportunity to test the process, so cannot comment on its application, chemically, but feel constrained to make some comment on the mechanical details, apparently necessary for the success of this, or for that matter any other, method.

Mr. Zachert proposes to amalgamate his sand in an acid solution containing also copper sulphate, and by the use of zinc amalgam; it is evident that to do this in the ordinary course of either dredging or hydraulic operations would be impossible owing to the amount of water in constant circulation. Hence we must concentrate the sand in some way, before submitting it to this process, and Mr. Zachert is good enough to recommend the Neill jig for the primary step in this concentration, which he describes as "a rough concentration" from which a "sand-concentrate can be produced averaging 75 cents to $1 per ton."

Right here it must be stated that Mr. Zachert has overestimated the degree of concentration commercially possible with the Neill jig as now used on dredges and in the 'undercurrents' of hydraulic mines; in both cases the material passing into the jigs carries values of not more than three cents per yard, oftener much less, and as it is desired to make a clean tailing, regardless of the quantity of the concentrate produced, it is customary to bed the jigs so as to make from 1000 to 1500 lb. of concentrate per jig per hour, and this material is carried from the jig through openings averaging ⅜ inch in diameter, which deliver about 20 to 24 gal. of water per minute.

As the jigs handle from 10 to 15 tons of sand per hour, it will be seen that the degree of concentration usually attained is about 20:1, or, if we should save all the contents of the heading in the concentrate it would not run over, say, 60c. in gold, and a very small fraction of this value in platinum. In a former issue of your paper I have shown that on the Yosemite dredge we saved in the riffle system 0.25c. per yard of bank dug, and the tests described indicated a loss of possibly twice as much more; but, this loss when calculated on the yardage of material passing through the screens, and so over the riffles, would make a platinum content of about 1c. per yard as a maximum, and if all this were saved in the jig-concentrate a value for these of 10c., associated with the above 60c. in gold. This estimate of 1c. is based on only one series of tests, and is no doubt much above the average of the value of usual dredging work.

It is evident that the application of Mr. Zachert's chemical method to the handling of this large mass of material is not practicable, certainly not on board a dredge-boat, and hardly at a hydraulic mine.

The dredges at Folsom, California, are equipped with eight jigs each, and they are equipped with ball-mills, one on each side, to grind and polish the jig-concentrate before amalgamation, and these mills handle from 40 to 60 tons per day, an effective de-watering being accomplished by the scoop-feeders. For a plant designed to use the Zachert method, it would be necessary to have reasonably clear water, so as to maintain the desired acidity; this is not obtainable on a dredge-boat, the pond-water being oftener thin mud than clear water. Therefore, it would be necessary to re-concentrate the jig-concentrate on board the dredge, bringing it up to a point where it is nearly pure black sand, this to be caught in proper boxes, drained, sacked, and removed from the dredge, for the Zachert process to complete the treatment on the solid earth.

In my previous article I have shown that it is possible to run a Wilfley table on board a dredge, but it is a difficult operation, it would require close adjustment and close watching, and it would take a large area on deck for the tables, which have a capacity of not over 25 to 39 tons each.

None of these objections apply to the jig, and there is no reason why the jig-concentrate might not be elevated to an upper deck, and there run over another jig, one of which would handle the output of all the others (eight) on the dredge. By proper and easy adjustments this second jig may be made to produce a practically pure black-sand concentrate, it would require but little attention or adjustment during the ordinary day's run, it would take very little deck-space, little power, and no clean water. This mechanical equipment would produce the concentrate desired by Mr. Zachert for his process, and his manipulations would be carried out in a proper plant, and under proper conditions away from the troubles of the dredge or hydraulic sluice.

As to the possibilities of losses being incurred in this re-treatment of the jig-concentrate, it may be said that any gold or platinum, or indeed any other metal or mineral, that is saved by the primary jig out of the

dredge or hydraulic sluice, will certainly be saved in the second operation, as this jig will receive a perfectly sized feed, with only the amount of water needed for the best working of the machine, and with all other conditions better than is possible on the primary jigging operation.

JAMES W. NEILL.

Formulas for Mine Valuation

The Editor:

Sir—The mining world certainly is indebted to W. W. Whitton for his excellent article on 'Formulas for Mine Valuation' in the MINING AND SCIENTIFIC PRESS of May 18. It is seldom that one has the privilege of reading such a detailed discourse on the derivation of mine-valuation formulas. The able discussion of Whitton's article by D. B. Morkill in your issue of August 31 brings out another phase of the matter, and both articles are worthy of careful consideration. The derivation of the Hoskold or of any other mine-valuation formula, although not difficult, nevertheless requires a careful manipulation of arithmetic and algebra. Most of us are prone to take the formulas for granted without going into the why and wherefor of them. The common method in use by engineers is to take the values as given in Hoover's excellent 'Principles of Mining', and consider the matter ended. The tables given by Hoover were developed by the use of what was originally known as the Hoskold formula. In the past little thought has been given to the possibility that these tables might be in error. I doubt whether many mining engineers have ever tried to reason out and derive the formula as is so ably done by Whitton. After 40 years the formula and tables are called in question, and they either must be supported and proved correct or another must be adopted.

Let us therefore compare the three formulas, as given by Morkill, and consider the merits of each, using as far as possible the same notation, namely:

j = rate at which the sinking-fund is to be placed at interest.

i = rate to be realized on the mining investment.

d = amount of annual dividend in dollars.

n = years of life of the mine.

I shall use three different V's as follows:

V_H = present value of the investment by the Hoskold formula.

V_W = present value of the investment by the Whitton formula.

V_M = present value of the investment by the Morkill formula.

In the case of V_W and V_M, it seems that they really indicate the present value of the profit on the ore remaining in the ground at the particular time in question, and not the value of the investment.

Using the special case, as was done both by Whitton and by Morkill, we have a mine with an expected life of 10 years, paying an annual dividend of $1000, the rate allowed on the investment being 10% and the redemption-fund drawing an interest rate of 4%. Throughout this article these values and results will be used enclosed in parentheses.

The three formulas are as follows, with the investments computed from them:

$$\text{Hoskold, } V_H = d\,\frac{(1+j)^n-1}{(1+j)^n i - i + j} = \$5455.81 \qquad (1)$$

$$\text{Whitton, } V_W = d\,\frac{(1+i+j)^n-1}{(1+i+j)^n i + j} = \$6591.37 \qquad (2)$$

$$\text{*Morkill, } V_M = d\,\frac{(1+i)^n-1}{(1+i)^n - i} = \$6144.58 \qquad (3)$$

By using the above three formulas, three tables can be calculated, as given in the Morkill article, and repeated here for use in the discussion.

Hoskold Table 2

Year	V_H	d	$V_H i$	$(d-V_H i)$	Amount in sinking-fund
1	$5455.81	$1000	$545.58	$454.42	$454.42
2	5455.81	1000	545.58	454.42	972.02
3	5455.81	1000	545.58	454.42	1418.52
4	5455.81	1000	545.58	454.42	1929.68
5	5455.81	1000	545.58	454.42	2461.28
6	5455.81	1000	545.58	454.42	3014.15
7	5455.81	1000	545.58	454.42	3589.14
8	5455.81	1000	545.58	454.42	4187.12
9	5455.81	1000	545.58	454.42	4809.03
10	5455.81	1000	545.58	454.42	5455.81

Whitton Table 2

Year	V_W	d	$V_W i$	$(d-V_W i)$	Amount in sinking-fund
1	$6591.37	$1000	$659.14	$340.86	$340.86
2	6250.51	1000	625.05	374.95	729.44
3	5861.93	1000	586.19	413.81	1172.42
4	5418.94	1000	541.89	458.11	1677.43
5	4913.93	1000	491.39	508.61	2253.13
6	4338.22	1000	433.82	566.18	2909.44
7	3681.91	1000	368.19	631.81	3657.62
8	2933.72	1000	293.37	706.63	4510.56
9	2080.78	1000	208.08	791.92	5482.90
10	1108.44	1000	110.84	889.16	6591.37

Morkill Table 3

Year	V_M	d	$V_M i$	$(d-V_M i)$	Amount in sinking-fund
1	$6144.58	$1000	$614.46	$385.54	$385.54
2	5759.04	1000	575.90	424.10	809.64
3	5334.94	1000	533.49	466.51	1276.15
4	4868.43	1000	486.84	513.16	1789.31
5	4355.27	1000	435.52	564.48	2353.79
6	3790.79	1000	379.08	620.92	2974.71
7	3169.87	1000	316.99	683.01	3657.72
8	2486.86	1000	248.68	751.32	4409.04
9	1735.54	1000	173.55	826.45	5235.49
10	909.09	1000	90.91	909.09	6144.58

Morkill also calculated the interest-return to the investor based on the original amount of the investment for each of the three formulas. The results are given in the following table:

*It seems that there must be an error in the Morkill formula as printed in the 'Mining and Scientific Press' of August 31, for I find by derivation, based on Morkill's assumptions, that the resulting formula should be:

$$V_M = d\,\frac{(1+i)^n-1}{(1+i)^n i} = \$6144.58 \quad (3A)$$

The last expression for the formula will be regarded as correct in this discussion.

Table 4

Year	Hoskold %	Whitton %	Morkill %
1	10	10.00	10.00
2	10	9.48	9.62
3	10	8.89	9.21
4	10	8.22	8.75
5	10	7.45	8.24
6	10	6.58	7.70
7	10	5.58	7.09
8	10	4.45	6.43
9	10	3.16	5.69
10	10	1.68	4.89

NOTATION. Before examining the formulas and tables it will be advisable to look over the notation and study the meaning of each. (1) i = the rate to be realized on the mining investment. I believe that it would be better to say that i expressed the rate of the annual dividend. This is indicated in Table 1, page 46 of Hoover's 'Principles of Mining.' (2) d = the amount of annual dividend in dollars. My understanding of annual dividend is that it is the amount of money paid to an investor on his share in a property. I would prefer to let d = the amount of annual net profit in dollars from the ore or property; d is then made up, as is easily noted, of two parts, namely, the annual dividend in dollars, Vi, and the annual amount set aside in the sinking-fund, d-Vi. (3) V = the present value of the investment. This statement is true for the Hoskold formula and table, but it seems that it is used incorrectly in the Whitton and Morkill tables, for they both allow it to decrease. From their values for V in the tables, it seems that they intended V to equal the present value of the profits on the ore remaining in the mine. Surely it is unreasonable to say that the present value of an investment during the tenth year is equal to $1108.44 as given by Whitton, or $909.09 as given by Morkill, when Whitton also has $5482.90 and Morkill $5235.49 in their respective sinking-funds.

FORMULAS. Hoskold's formula is based on: (1) A constant value, V_H, for the investment throughout the life of the property; (2) a constant rate of interest, i, (10%) in the specific case given; (3) this results in a constant return, $V_H i$, from the investment; (4) equal amounts, d-$V_H i$, are thus put aside in a sinking-fund at a safe rate of interest, j, (4%) which will return the amount of the original investment ($5455.81) at the end of the specified period of 10 years.

Whitton's formula takes into account: (1) A decreasing value, V_W, for the investment; (2) a constant rate of interest, i, (10%) on this investment; (3) the result is a decreasing return, $V_W i$, from the investment; (4) increasing amounts, d-$V_W i$, are put aside in a sinking-fund at a safe rate of interest, j, (4%) which will return the amount of the original investment ($6591.37) at the end of the specified period of 10 years.

Morkill's formula follows much the same reasoning as that in Whitton's. (1) A decreasing value, V_M, for the investment; (2) a constant rate of interest, i, (10%) on this investment; (3) the result is a decreasing return, $V_M i$, from the investment; (4) increasing amounts, d-$V_M i$, are put aside in the sinking-fund, which, without the interest, return the original investment ($6144.58) at the end of the specified term of 10 years; (5) we find later on that the sinking-fund is placed at interest, j, (4%), which is paid to the investors annually to increase their return from the investment.

A comparison of the first three tables reveals the following: Hoskold's table shows a simple distribution: (1) A constant value for the investment, V_H, ($5455.81). The amount of profit to be obtained from the ore unmined is constantly decreasing, but a corresponding increase in the sinking-fund takes care of this and therefore accounts for the constant value of the investment. (2) The annual amount realized from the investment, $V_H i$, ($545.58) is constant. (3) The annual amount set aside in the sinking-fund, d-$V_H i$, ($454.42) is constant. (4) The amount in the sinking-fund draws a safe rate of interest, j, (4%), which at the end of the specified period totals the amount of the original investment ($5455.81).

Whitton's table shows a changing distribution: (1) A decreasing value of the investment, V_W, ($6591.37 to $1108.44). (2) A corresponding decrease in the return from the investment, $V_W i$, ($659.14 to $110.84) due to the decrease in V_W. (3) An increase in the amount set aside in the sinking-fund, d-V_W, ($340.86 to $889.16). (4) The amount set aside in the sinking-fund draws a safe rate of interest, j, (4%), which is sufficient, when added to the principal, to return the original investment ($6591.37) at the end of the specified period of 10 years.

Morkill's table follows a similar method of distribution to that of Whitton except in the method of handling the interest from the sinking-fund: (1) A decreasing value of the investment, V_M, ($6144.58 to $909.09). (2) A corresponding decrease in the return from the investment, $V_M i$, ($614.46 to $90.91) due to the decrease in V_M. To this should be added the interest obtained from the sinking-fund as indicated in table 4. (3) An increase in the amount set aside in the sinking-fund, d-V_M, ($385.54 to $909.09). (4) The amount set aside in the sinking-fund, without interest, will equal the original investment ($6144.58) at the end of the specified period of 10 years. (5) The Morkill table leads one to believe that the sinking-fund does not draw interest. However, we find, by table 4, that the interest from the sinking-fund, at a safe rate, j, (4%) is taken in as a part of the return on the investment.

In table 4 a comparison of the three formulas and tables is given, based on the annual percentage-return to the investor on the amount of his original investment. Hoskold has a constant return of 10%; Whitton decreasing from 10% during the first year, to 1.68% during the last; and Morkill with the interest from the sinking-fund added, decreasing from 10% to 4.89% at the end of the period of 10 years.

SUMMARY. The three formulas are similar in at least a few respects. (1) They all provide for a return of the original amount of the investment at the end of the same period, namely, 10 years. (2) They all allow the

same rate of interest, *i*, (10%), on the present value of the investment as interpreted by each. (3) They all provide for a safe rate of interest, *j*, (4%), on the sinking-fund. Although the Morkill formula does not show this, nevertheless, Morkill uses the interest to pay an increased amount to the investors annually. The three formulas differ in a number of respects. The present value is constant in the Hoskold formula and table, and decreasing in the other two. In the Whitton, the present value is 20% greater than in the Hoskold at the beginning of the period, while the Morkill formula gives a present value 12.5% greater than the Hoskold. The result in the case of Hoskold is an equal annual return to the investor throughout the life of the mine, while in both the other cases the annual return is greater at the beginning of the period, and decreases to a minimum at the end. Finally, the amount placed in the sinking-fund is the same for each year in the Hoskold, while the Whitton and Morkill formulas indicate an increasing amount for each succeeding year.

CONCLUSION. From the standpoint of the investor, the value of the property is less by using the Hoskold formula, and this means a smaller original outlay to acquire the property. The interest, *i*, paid on this investment is uniform throughout the life of the mine, and equal amounts are set aside annually in the sinking-fund. The Whitton and Morkill formulas on the other hand give a greater value for the property, and the result is that a larger amount of money is needed in the original investment to acquire the property. The return on this amount is equal to *i* (10%), at the beginning of the period and then rapidly falls off, reaching a very small per cent during the last few years of the life of the mine. The effect of this on the investors can be readily foreseen, for when the decreasing returns become great the market-value of the investment will be decreased, although the investment is protected with a sinking-fund, and dissatisfaction will naturally result. Another point against the Whitton and Morkill formulas is the fact that, as the property is approaching exhaustion, the amount set aside in the sinking-fund reaches its maximum with over 90% of the profits turned into the sinking-fund during the last year. It is worthy of note, at this point, that the last two formulas, by their method of putting money into the sinking-fund, lose approximately 10% of the interest obtained by the Hoskold formula, and this is one of the factors that helps to increase the amount of money required by them. The owner of a property, who desires to dispose of it, may favor the Whitton and the Morkill formulas, because they would bring him a greater amount of money. He has good reason to be satisfied, but, I should like to know how he will be able to explain the decreasing returns based on the amount of money invested, and the increasing amount that must be set aside in the sinking-fund as the amount of ore decreases. If he can explain these points to the satisfaction of the party interested in the purchase the formula will meet with his approval, but the investor will be hard to satisfy in this respect.

Reviewing the merits of the three formulas and their weaknesses, I feel that they weigh most strongly in favor of the Hoskold formula, which gives a simple distribution of the profits and an unchanging return on the original investment rather than a decreasing one, and a possibility of increase if new orebodies are developed. With due respect to Whitton and Morkill for their excellent work, I recommend that we continue to accept the formula and table originally developed by H. D. Hoskold.

El Paso, Texas, October 2. H. D. PALLISTER.

The Value of Gold

The Editor:

Sir—It is somewhat of a joke, but at the same time tragic, for the small producer of gold (I mean the real little fellow), to have read of the shortage of this metal, and how the Government, and various mining institutions were endeavoring to devise some satisfactory means of relieving and helping the gold miner, he receives a 'knock out' from the smelter in the shape of a reduction of 50c. per ounce on the value of the gold he ships.

I have shipped in the neighborhood of 60 to 70 small parcels of zinc precipitate from this district, and in no case has the smelter paid less than $20.50 per ounce for the gold. This is a small property worked by three partners, who for the past three years have had a struggle to make ends meet. The first parcel of precipitate that I shipped to the smelter paid, after the usual deduction of 2½%, $20.50 per ounce, but for the following one shipped on October 3 they have deducted the usual 2½% and pay $20 only for the gold.

P. R. TURNER.

Tuber Canyon, California, November 4.

In Memoriam

The Editor:

Sir—Your issue of the 26th mentions the visit of C. E. Watson and G. O. Randolph to the Engineer mine near Atlin. You have, of course, the news of the disaster to the ship 'Princess Sophia' near Juneau. As I am familiar with the object of that visit and the personnel of the party that included those men I thought you might be interested in an authoritative statement.

The party that boarded the 'Sophia' at Skagway included, besides Messrs. Randolph and Watson, Capt. James Alexander and his wife, Clarence S. Verrill, a mining engineer of Vancouver, B. C. Mr. Verrill was a prominent engineer of 20 years experience in Colorado, California, Idaho, and B. C. He was identified with the recent deal which brought about the sale of the Surf Inlet mine. He held the option that was taken up by the Tonopah-Belmont company. He was a man of high ideals and a clear record, and an honor to the profession. He was a Yale man, the son of Prof. A. E. Verrill, who has been identified with the university for upwards of fifty years. Capt. Alexander was the owner of the famous Engineer mine in the Atlin district.

WAYNE DARLINGTON.

Well-Drill Blasting

By J. C. COSTELLO

An exhaustive study has been undertaken in order to ascertain and point out as far as possible the element of danger that exists during the operation of loading and shooting 'sprung' holes. The main purpose of the investigation centred upon that common class of blasting, generally known as 'heavy sprung' well-drill holes, a class of work that has come into being and is now largely employed by practically all the large copper-producing companies in the West.

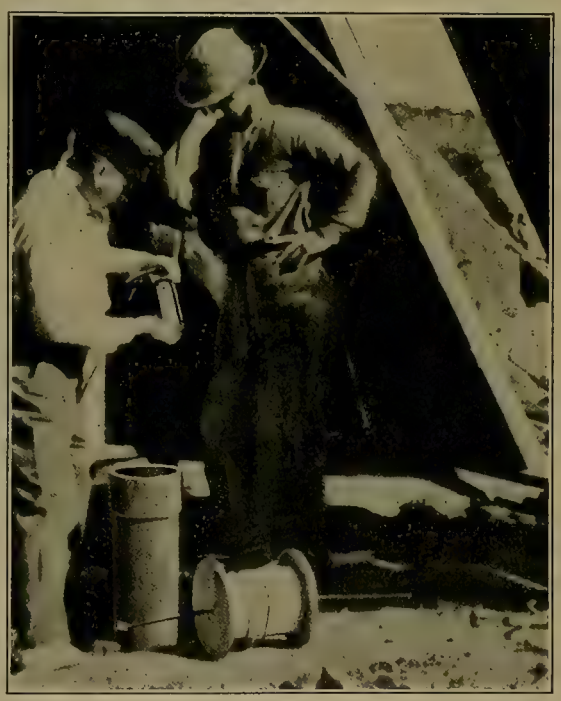
It is generally recognized that the ideal manner of shooting well-drill holes is under the so-called 'straight' method, that is, loading high in the barrel. Springing deviates largely from the original idea of shooting away from the bank, leaving the holes clean cut throughout their entire length and sheared from top to bottom. Instead of producing such a condition with sprung holes, the mass in reality is simply raised and dropped. No doubt both methods offer advantages dependent upon the field conditions. The straight method is to be recommended, first, as simple and safe for the reason that no foreign heat is injected into the hole by the explosion. Again, no heat is created by friction through the compression or rending of the rock caused by springing; second, loading high in the barrel no doubt breaks the mass smaller and in more uniform sizes, for the reason that a larger amount of the charge is in direct contact with the mass; third, shots loaded high in the barrel generally throw and spread the mass over a greater area of the quarry-floor, affording a greater opportunity for distribution and classifying. Again, this method offers greater safety by leaving the banks sheer, avoiding 'hang-ups.' The straight method also offers more advantages for hand-loading.

The particular field-conditions favorable to 'springing' may be outlined as follows: First, a saving is obtained in drilling expense, as the spacing of holes under this method is always much greater; second, heavy 'break backs' are encountered that could not be hoped for under the straight method; third, the excavated mass can be confined to a small area by simply lifting and dropping it, thereby avoiding the chance of scattering over a large area of quarry-floor. This method is especially applicable for economical handling with heavy steam-shovels, as it reduces expense in moving shovels and in shifting track. Again, heavy toes can be handled under this method by drilling below the quarry-floor; this is not possible under the straight method, which requires a sheer face. It is, however, practicable to maintain a sheer face if governed by proper spacing, and while many things can be said in favor of the method of 'springing' well-drill holes still this practice is largely recognized as an infringement on the 'coyote' method, and in fact by some authorities it is considered an improvement over that method from the standpoint of economy.

There are disadvantages is both systems, which may be summed up, as follows:

The straight system requires closer spacing, therefore, more expense in drilling, but in a large degree the powder costs under this method can be materially reduced.

'Straight' shooting requires practically a perpendic-



READING THE TEMPERATURE OF A HOLE 141 FT. DEEP

ular face for the best results, because one can employ only as much breaking-power in the bottom as along the entire length of the barrel.

Under ordinary working conditions, even though the well-known method of separating the charges in the barrel be employed for the purpose of avoiding overshooting the weak spots or regulating the fall, the mass cannot be successfully controlled in an effort to simply drop it into a small pit on the floor, and in such cases, where there is only a small space available for dropping the excavated mass, or where the tracks are liable to be covered on short levels, the straight system is usually at

a disadvantage. On the other hand the springing method no doubt carries with it three distinct disadvantages, namely; in hard formations the mass cannot be broken as well, chiefly because the charge is seated in a pocket, as when the 'coyote' method is employed, and does not come in contact with the mass in general; the banks cannot be maintained uniform on account of uneven 'overbreaks', which at times prove an inconvenience and added expense in maintaining the tracks on the levels that have been over-broken. This disadvantage, however, can be overcome to some degree by close attention on the part of expert powdermen; finally, the hazard connected with re-loading sprung holes is generally recognized by competent powdermen, and this question was given the larger amount of attention during this study. I would say unhesitatingly that springing and re-loading of well-drill holes should be entrusted to the care of expert men only, and then the work should be conducted always with caution to avoid accident. It should be remembered that the temperature of the rock in the hole after it has been sprung is an unknown factor. Repeated springing produces heat in the bottom of the hole in two ways, namely, the actual heat developed by the explosion is communicated to the side-walls of the hole, this representing one source of heat, and next, the heat stored up in the disintegrated rock, which had been at or near incandescence, and which will not readily part with its heat after the explosion, since a pulverized mass of rock is a highly non-conducting medium.

Again, tests made by springing mineral-bearing rock show the development of more heat than is present in ordinary rock. Another factor, which is always indefinite, is the temperature of the rock back from the surface of the sprung portion of the hole. After repeated springing, the rock may be heated to the extent of more than a foot from the exposed surfaces of the side-walls. After a time the surface of the rock will cool, facilitated by cleaning out, so that temporarily the wall is cooler than it will be at a later period after the still heated rock has had time to re-heat this outer zone even though some of the débris might have been blown or sludged out. The chance for a premature explosion would in this case be greatly enhanced if tamping had already commenced, thereby preventing the escape of accumulating gases.

During this study, a record of a well-drill hole 86 ft. deep, drilled in hard mineral-bearing rock, proved of great interest. Immediately after the drilling tools were removed, the following records were established with a recording thermometer:

	Temperature, deg. F.
Immediately after the tools were removed	92
10 minutes " " " " "	90
20 " " " " " "	90
30 " " " " " "	90
3 hours " " " " "	90

Therefore, 90° Fahrenheit was taken as the established normal temperature of the hole, and it was further assumed that the loss of two degrees from the first record was the result of the hole being slightly heated under the drilling process. The hole was then sprung with 42 lb. of 40% powder, four barrels of water-tamping being used, which raised the water to a height of about 7 ft. in the barrel. The springing-charge as usual threw most of the water out of the hole, leaving about 4 in. of water in a sump in the bottom of the 'spring'. The following recording-thermometer records were then established:

	Temperature, deg. F.
Immediately after first spring	96
10 minutes " " "	98
20 " " " "	100
30 " " " "	98
40 " " " "	94
50 " " " "	92
1 hour after first spring	92

1 hour 30 min. after first spring	90
5 hours after first spring	90

It is plain therefore that the temperature of this hole apparently started to increase, that this was maintained for 20 minutes after it was sprung, after which it commenced to recede and reached its normal 1 hr. 20 min. after the first spring. The rise in temperature after the first reading, no doubt can be accounted for by the temperature of the water holding it down, being scattered throughout the spring and along the sides of the barrel, but gradually the heat injected into the rock re-appeared on the side-walls, resulting in the warming of the water and the rise of temperature as shown. Now, reasoning from similar relationships, and as further substantiated by other experiments, it is safe to say that, had this charge been greater, it would have required a greater amount of time to reproduce the normal temperature of the hole.

Another case of record is worth mentioning; a hole 91 ft. deep had been drilled in a hard mineral-bearing rock and repeatedly sprung, 950 lb. of 40% powder being used in the last spring. On top of this, 27 ft. of solid tamping had been used in an effort to protect the barrel. Nine days after this hole was last sprung instructions were given for loading and shooting it. Finding that the solid tamping had not blown out, a drill was put over the hole which cleared it. A recording thermometer was then lowered, and the following temperatures were determined: Immediately after hole was cleared, 197° F.; the thermometer quickly receded, and within six hours after the hole was cleared, 94° F. was established, which was considered the normal temperature of the hole. Loading of the hole then proceeded. Had the recording thermometer in this case failed to serve as an alarm, an accident would have probably resulted, since the nine days that had elapsed since the springing of the hole would have made it appear safe. In this case, however, it was decided that the heat was retained in the hole by the tamping failing to blow, and was held as in a thermos bottle. Under these conditions, the loading of a 'sprung' hole should always be done with a proper understanding of all the factors involved, and when a hole has been repeatedly sprung for the purpose of producing a large chamber, proper conservatism should be exercised in determining what is a safe time after the last spring before attempting to load.

Some years ago I advanced the theory and recom-

mended the use of a recording thermometer as a means of determining the temperature in well-drill holes, and I find that the theory and practice were misunderstood, as I have been continually asked for information regarding the ignition-temperature of various explosives. The facts are that I have used the recording thermometer only as a guide to the temperature of the hole, as the results so obtained are relative only. It would be by chance only that a thermometer would be in contact with the hottest portion of the rock. In addition to this factor of error, it should be remembered that the rock may be much hotter back from the surface of the spring than it is in contact with the sides, since the side-walls are cooled to a considerable extent by air currents set in motion by the warmth of the sides, and thus the higher temperature a few inches back in the rock is only developed after the expiration of some time. Again, in holes that have been heavily sprung, it was found quite impossible to get a thermometer back against the side-walls of the spring, which no doubt was the hottest part of the hole, and while I highly recommend the use of a recording thermometer, it is only with the idea of establishing the normal temperature of the hole and of preventing the loading of explosives in any hole above its normal temperature.

In this connection it should be remembered that all commercial explosives are inflammable and will burn when they are sufficiently heated. If, for example, any of the commercial explosives are brought in contact with a piece of rock or other material, which has been heated to 300° or 400° C. they will at once be decomposed, and will either begin to burn or will detonate. Nitro-glycerine explosives usually detonate with violence when thus over-heated, especially if confined. Nitro-starch explosives will also detonate under these conditions if considerably confined, but under normal conditions nitro-starch explosives will usually burn quietly unless so confined in a hole as to make the escape of their combustion-gases difficult or improbable.

In determining the ignition temperature of any explosive, it is necessary to bear in mind the distinction between the actual temperature to which the material is heated and the time during which the material is kept at such a temperature. At a red heat, all explosives will burst into flame or will detonate practically instantaneously, while at a lower temperature an increasing amount of time is required before ignition or before explosion occurs. In all cases, the time-factor is important and should not be disregarded.

In thawing dynamite, it has sometimes been the practice to place frozen sticks in an inner can surrounded by an outer jacket of boiling water. Experience has shown that frequent accidents have occurred in this way when a stick of dynamite has been left in the thawing kettle for more than a few hours, and, while dynamite withstands heating to the temperature of boiling water, longer exposure at exactly the same temperature may bring about sudden detonation of the material. While Trojan explosives withstand considerable over-heating, yet prolonged exposure to too high a degree of heat will of course produce ignition. Since experience has shown that the hot sides of sprung-holes will, under certain conditions, retain their heat sufficiently long to cause difficulties where the powder comes in contact with such heated rock, tests have been made to determine the relation which exists between the temperature and the time of heating. These tests, made with standard grades of 40% Trojan explosives, were made under the most careful laboratory supervision, and show the temperature and the amount of time to be applied before ignition takes place.

Temperature, deg. F.	Min.	Sec.
401	6	8
392	9	2
383	11	2
374	19	1
365	31	6
356	53	4

These tests show in an interesting manner the relationship existing between the temperature and the time of ignition. Again, the relationship between the temperature and the time of heating becomes involved with the quantity of explosives under the test. With larger quantities of explosives, the relationship between the temperature and the time of heating becomes involved, through the introduction of a number of secondary factors, of which the principal is the retention by the sample of the heat, which is produced by the exothermic reaction occurring when an explosive is decomposed, and further proves that an explosive substance slowly decomposable at a certain temperature is able to exist at higher temperatures, though during a gradually shortening interval. Considering the fact that small samples of Trojan explosives fail to ignite when heated to temperatures between 302° and 347° F. under careful tests, it would be unwise to apply this rule in practice under ordinary loading conditions, as, under the tests, the ease with which the heat evolved by decomposition is lost, by no means would apply to large quantities of explosives seated in a charge and packed in a bore-hole. In order to ensure the highest degree of safety and to avoid the chance of accident, from the loading of sprung holes with any of the commercial explosives, I would say first that it is necessary to establish the normal temperature of the hole and to allow no explosives to be loaded in any hole above its normal temperature, as the product of all reliable manufacturers of explosives can be relied upon to resist such conditions with perfect safety.

Personally, I would have no fear of loading Trojan explosives under ordinary working-conditions in a hole the temperature of which was not in excess of 140° F., provided that the normal temperature of the same hole was not less, and, further, that the origin of the heat-factor was natural and definitely established. As all such hole temperatures are abnormal, the pre-determined or original temperature of the hole before it was sprung would be fully taken into account and reckoned with, for reasons of safety.

The highest temperature ever recorded by the U. S. Weather Bureau shows a maximum of 134° F. established

at the Greenland ranch in Death valley during the month of July 1913. While Trojan explosives under no conditions would ever decompose under such temperatures, and in fact resist temperatures beyond the boiling point, 212° F., for days, still it would be folly to assume the risk of loading explosives in a hole containing foreign heat of any character, for the reason that you are then dealing with the unknown, and that is one of the most dangerous elements connected with the operation of loading. Therefore, all abnormal hole-temperatures should be considered a danger-signal, regardless of their range, principally from the fact that they represent unknown factors, and, under ordinary working-conditions, their highest range, for reasons already outlined, cannot be definitely proved. From established records by thermometer covering 841 well-drill holes, extending from 36 to 141 ft. in depth, and 86 tunnels or 'coyote' holes, the highest normal hole-temperature ever encountered was 98° F., although these records were taken all over the United States and Panama, where intense heat prevailed, and for this reason I consider 98° F. a maximum normal hole-temperature. Even under such working-conditions as are found in the hottest part of the States, in order to ensure greater safety, any hole showing a higher temperature than this or any maximum established in the same way on any particular work, should be considered dangerous and loading should not proceed before the cause of the excess heat had been definitely determined.

I am thoroughly convinced that if these suggestions were to be put into practice, they would entirely obliterate all chance of accident from this source, and while an extended series of laboratory and field-tests have shown that Trojan explosives of all grades successfully resist heating in a satisfactory manner, and that ignition is difficult to produce by over-heating these explosives, the loading of explosives into holes that show abnormal temperatures or a high degree of rock-heat, is strongly to be condemned. It would represent a wholly unnecessary hazard from the factors of hidden rock-heat; and also from the effect of continued exposure of the explosives for long periods of time to relatively high temperatures. This becomes necessary where the hole is to be loaded with a heavy charge, which means a prolonged loading-period.

Care should always be exercised by well-drill foremen in closely watching and reporting to the powder-foremen any abnormal condition encountered during the drilling. In case the drill should break through into any old working, such facts should be made known to the powder-men. All holes should be covered by the drillers, and care should be exercised to prevent anything dropping into them that will either catch fire or retain heat. When a springing-charge is fired, heat is always liberated in the explosion, and as the amount of heat per unit-weight of explosive is an important factor governing its power, this feature cannot be avoided and must be reckoned with, as the springing-charge is liable to fire any inflammable material in the hole or to so impregnate any conductor of heat as to become highly dangerous to loading or to additional springing operations. It should also be remembered that the sensitiveness of most explosives increases as their temperature rises, and while nitro-starch explosives are not highly inclined to such behavior, an excessive or abnormal heat should be avoided in the handling of any explosive. For instance, as pointed out by many authorities, nitro-glycerine confined between steel plates requires, under the fall of a hammer, for detonation:

Temperature, deg. C.	Energy, Mkg.
16	0.2
94	0.1
182	slightest blow

This shows that only one-half the energy is required to detonate the nitro-glycerin at a temperature of 94° C. as is required to accomplish the same purpose at 16° C., and it further proves that high abnormal temperatures of explosives would tend to make detonation more easily possible by rocks or other substances being accidently dropped into the hole. In reality explosive reactions can be attributed to a preliminary heating that may be gradually transmitted, directly or indirectly, thus raising successively all the parts of the total volume of the substance to the temperature of decomposition. Shock, pressure, friction, or mechanical effects, in reality play their part in detonation by causing preliminary heating. Therefore, from this standpoint abnormal temperature should be guarded against, and, to ensure the highest factor of safety, it should be avoided entirely.

A LARGE PROPORTION of British-controlled mines in Canada have been unprofitable. However, there have been a few outstanding instances of large profits. Such an instance is that of the Mond Nickel Co. In 1906 it first commenced to pay dividends on the ordinary shares at the rate of 6%; but the profits increased so rapidly that seven years later the dividend rate on the ordinary shares was advanced to 35%, and the holders of the deferred shares received 158%. In the same year the capital was reconstituted, each £5 preference share being exchanged for five new shares of £1 each, for each ordinary £1 share a 7% preference and 1½ ordinary shares were given; and the £1 deferred shares were exchanged for nine ordinary shares. The capital at present consists of £1,880,000 in shares, £375,000 in 5% first-mortgage debenture stock, and £500,000 in 6% redeemable debenture stock. Of the share capital £500,000 is in 7% cumulative preference, £480,000 in 7% non-cumulative preference, and £900,000 in ordinary, the issues being of £1 par value in each case. From a modest beginning of a profit of £2095 in the second year of the original company's existence, there was an almost continuous increase to £300,296 in 1914-15, raised in the following year to £322,589, then to £327,248 in 1917, and to £531,846 in the past 12 months. Naturally the company could not have achieved these results if it had not possessed very valuable and extensive orebodies; but not the least of its assets has been and is the skill, efficiency, and brains of its management.—Canadian Mining Institute Bulletin, November 1918.

The Future of Dredging

By CHARLES JANIN

*The highest point of production for the gold-dredging industry in the United States has been reached, and during the next few years a marked falling off in gold production from dredging operations may be expected. The success attending the flotation of the larger dredging companies proved an incentive for explorations and examinations in various States, and all land thought attractive for dredging was soon taken. The problem of finding suitable ground for dredging is difficult, although with the great improvements made in dredging machinery and the resultant reduction in operating costs, it is obvious that gravel beyond the possibility of economic dredging under early conditions could now be profitably handled. This is shown by the operations of nearly all the large dredging companies whose available dredging ground has been greatly increased as working costs have been reduced.

A fact that also draws attention to areas once considered unprofitable is that the life of some of the successful dredging companies is drawing to a close; that is, the land for the working of which the companies were originally formed is being rapidly worked out. Several of these companies are realizing that their ground is nearly exhausted and that they have some dredges in good condition, fit for some years of operation. What is probably more important, they also realize that they have also well-organized working forces, valuable experience in dredging matters, money in the treasury, and the confidence of shareholders. Aside from such influences, there is no question that under favorable conditions areas that were once considered unsuitable for economic dredging can now, with improved methods, be profitably handled. The possibilities of reclamation of dredged land may prove important in estimating the profits to be won from dredging areas in California. The success attending the efforts of some experiments in this direction in a small way has greatly broadened the expectations for the future of what was, until recently, considered worthless land. A more liberal attitude on the part of the agriculturists and arrangements permitting the modification of some of the rulings of the Debris Commission in California would open to the dredging industry areas that are at present closed.

The possibility of re-dredging the tailing from the early dredges at Oroville, partly with the idea of reclaiming lands that would command a fair market, is occasionally discussed in the non-technical press. This proposal has not met with any enthusiasm among the conservative operators, but it should be realized that the greater improvements in the dredging industry are not due to the most conservative men; one must be optimistic to undertake new methods. Altogether it seems probable that dredging enterprises will continue in California for some years to come, although the amount of gold won from dredging operations in the State was at its peak in 1913. During 1915-'16 there have been a number of new dredges planned and at the time this is written there are nine new dredges either under construction or projected for the Californian fields alone. Four of these are 16-ft. boats, three 9-ft., and two are old dredges being moved to new locations. The writer pointed out in a paper read before the San Francisco meeting of the American Institute of Mining Engineers in California, 1911,† that dredges of even larger capacity than those now in use for gold dredges had been considered in the reclamation of dredged areas. The following extract from the paper is pertinent:

With the development of the gold dredge to its present efficiency, the question is often raised as to when the limit in size for economic dredge installation will be reached. Much depends upon the conditions met in operation. There is no question as to the mechanical possibility of larger buckets. In Boston harbor a bucket-elevator dredge equipped with buckets of 2 cubic-yard capacity has been successfully operating for some years on harbor work, and on the Danube river in Germany a bucket-elevator dredge having 2.5 cubic-yard buckets is now in operation. While the mechanical possibilities have thus been proved, to apply such radical changes in size to the gold dredge of today would necessitate an entirely different arrangement of the gold-saving tables and would probably result in a general modification of the whole gravel-washing apparatus now in use. Even the most optimistic advocates for increasing the size of the dredge buckets would hesitate at recommending a 2 cubic-yard bucket, which is nearly four times the present size of the buckets on the largest gold dredges in operation, but there are a number of engineers who believe that the bucket-elevator dredge with buckets having a capacity of 1 cubic yard will be constructed before long. While a dredge of this character would necessarily be equipped with heavier machinery and a larger hull than those on the present 15 cubic-foot boats, it is, as before stated, quite possible that, with modifications of the washing apparatus, the hull of the 1 cubic-foot dredge may not be proportionately larger. The present 15 cubic-foot boats have a hull 60 by 150 by 12.5 feet, with a deck overhang of 5 feet on either side, making a total width of 70 feet. The gold-saving tables are of the double-bank type and have an approximate area of 7000 to 8000 square feet. Without some change in the washing apparatus, it can readily be seen that 14,000 square feet of table area would necessitate a hull of greatly increased

*Excerpt from 'Gold Dredging in the United States', U. S. Bureau of Mines.

†Janin, Charles, 'Present-day problems in California gold-dredging': Trans. A. I. M. E., Vol. XLII, 1912, pp. 855-873.

size, or additional tiers of tables, for which an increased length of bucket ladder would be required to elevate the gravel to the additional height, or a general change in the design of the boat. Practice has demonstrated that when digging free-washing gravel the table area of the 15-foot boats is considerably in excess of all requirements, and some operators contend that it would not be necessary to proportionally increase the table area when buckets of 1 cubic-yard capacity are constructed.

There may be a field for dredges of this size, for instance, in the Oroville and Folsom fields, to re-dredge the tailing piles left from the first dredging operations. After many of the cobbles have been removed for the rock-crushing plants, the ground, if dredged, will, in many cases, yield a fair return. Especially would this be the case in the areas where the early dredges worked, as the gold-saving apparatus of the first successful dredges was not as efficient as that in present use.

In Alaska the success attending the operations of some of the dredges recently built there has greatly widened the field for the dredge-construction companies. Previously the demand has been for small dredges, especially on the Seward peninsula, but the successful operation of the large dredges of the Canadian Klondike Co. on the Yukon, and the Bonanza Creek operations of the Yukon Gold Co. have encouraged investigation of areas in other parts of the northern field. Unfortunately, many of the dredges built in Alaska have been constructed prior to adequate prospecting of the ground they were to work. Failure to sample a dredging property until the dredge has been built, when 'large practical samples' can be taken, is almost to invite loss. Although the dredge may prove a success mechanically, the company is generally doomed to economic disaster unless more favored with good luck than good judgment.

Besides the possibility of new dredging enterprises in California and Alaska, the attention of dredge operators is being attracted to areas in other Western States where the gold content has previously been considered too low. The difficulties surmounted in dredging operations in California, Montana, Colorado, and other fields, and the low working costs obtained in these fields and in Idaho, open possibilities unthought of a few years ago.

In addition to the possibilities in the United States and Alaska, considerable attention has been given to foreign districts. Chief among the countries being considered are Russia, including Siberia; South America, principally Colombia; and the Federated Malay States. The success attending the work of some Russian dredges and the purchase early in 1916 of three American dredges for Russia has stimulated inquiry into the possible openings for American capital in dredging projects in that part of the world. It is rumored that the Russian government has considered the advisability not only of taking off the high duty heretofore imposed on machinery for gold mining, but also of subsidizing to some extent gold-mining companies; such procedure would undoubtedly stimulate investigations of dredging areas in that country. In new enterprises in Russia or Siberia, it will be found advisable to have the assistance of influential Russians. It is held by engineers qualified to pass an opinion that in Russia and Siberia, so far as operating conditions are concerned, there are a number of areas of gravel that can be profitably dredged, and the examination of some of these fields may result in more dredges being erected in the near future. A pertinent point in this connection is that the Russian peasant in some localities makes a really first-class mechanic, so that it is not necessary for a foreign dredging company to import expensive laborers for all positions on a dredge. Conditions of operation in Russia and Siberia, aside from taxes and government regulations, are very similar to those in the Yukon and Alaska, and operating costs should, under ordinary conditions, be closely similar. The success made by the gas, oil, and wood engines in Alaska should encourage dredge installations in localities where electric power is not obtainable.

There are undoubtedly in Colombia and other South American countries areas that offer promising returns from dredging operations.

In the Philippines the success of the Guamos dredge has encouraged other operations and an American dredge built in 1914 for the Mambulao Dredging Co. embodies some striking innovations for generating power on board the dredge.

An American dredge was constructed for the Chiksan Mining Co. in Korea during the latter part of 1916. Its success will do much to encourage further dredge installation on the Orient. In Portugal a dredge built under plans of an American dredge-construction company for American capitalists is being operated in tin deposits, and its success has awakened interest in tin dredging. In 1915-'16, several orders for new dredges for the Malay peninsula were placed with American dredge-construction companies, and this region offers considerable promise to the wide-awake constructor.

Although there is room for considerable improvement in the gold-dredge, the wasteful and inefficient methods usually employed on tin-dredges should give our dredge-construction engineers a splendid opportunity for increasing the recovery. The profits made by some of the tin-dredges have been large, and doubtless no necessity has yet been felt for inquiring closely into methods for decreasing the loss in the dredge tailing. It is when low-grade material is handled that metallurgical methods are improved. It is probable that American operators will be offered more or less attractive opportunities to participate in some of these tin-dredging projects in the near future.

In making investments in dredging enterprises in foreign countries, as elsewhere, much money may be saved if prospective investors will insist on having reports by experienced engineers. With the drawbacks of operating in foreign countries, together with unusual government regulations, and other disadvantages incident to dredge work away from home, possible dredging areas in the United States, though of lower grade than some that are being at present worked, and of much lower gold content than is necessary for profitable operation in foreign countries, will probably be more attractive to conservative investors than the foreign fields.

Differential Flotation of Lead and Zinc Sulphides

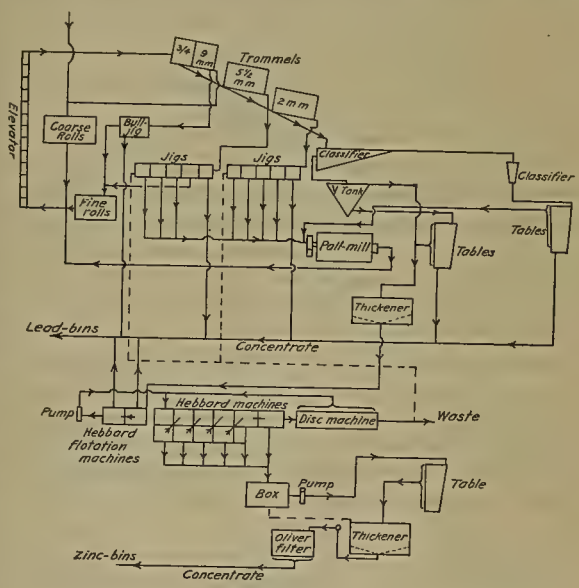
By ALGERNON DEL MAR

In oil concentration, no matter what oil or reagent is used, lead will always float more readily than zinc. Salts of chromium will deaden lead in preference to zinc, but experimentally I have always found the lead to float first. In the treatment of a lead-zinc ore there may be further differential concentration in separating iron sulphides from the lead or zinc. Copper sulphate will facilitate this separation; the same forces come into play, that is, the ease or difficulty with which the surfaces are wetted.

When the case is further complicated by a high silver content, the differential flotation of lead from zinc becomes more important, for it must be the aim of the metallurgist to throw as much of the silver, whether associated with the lead or not, into the lead concentrate as possible, since the smelters pay for the silver in the lead and its recovery from the zinc is unsatisfactory. The natural tendency in differential flotation is for the silver sulphides to rise with the lead in the froth, that is, if the conditions are such that the lead will rise in preference to the zinc, the silver will be found with the lead except where it is intimately associated with the zinc.

As a result of the ease with which lead is lifted in any flotation system, as compared with the zinc, the separation of the lead must precede that of the zinc. My experience indicates that a thicker pulp is advantageous for differential flotation of the lead. To float lead successfully the content in solids should be over 25%. In zinc flotation that is not so important, nevertheless better work is obtained in both cases with a thick pulp. I should place the limits for lead at 25 to 30% solid, and for zinc at 20 to 25% solid. It is important that in both cases the moisture content should be kept constant, any variation in this respect requiring an adjustment in the other factors. As all flotation machines are fed from a thickener of some sort the stream of pulp should be of constant thickness, whether the crushing end of the mill is at work or not. The usual plan is to vary the size of the spigot on the discharge of the thickener or to vary the speed of the pump connected with the thickener. For the successful separation of the lead sulphide from zinc blende, the volume of air, its pressure, or the speed of rotation of the agitating paddles or drums, should be less when frothing lead than when frothing zinc. For example, using an M. S. machine, the speed of the propeller shaft in successful lead flotation need not be over 200 r.p.m., but to raise zinc this speed must be increased to at least 600 r.p.m. At the latter speed, with the mixed sulphides, too much zinc would come up with the lead.

Another consequence of the tendency of lead to float first is that the quantity of reagent used in lead flotation must be that which is just sufficient to raise the lead, without any excess. Also the reagent need not be emulsified or pre-mixed, but may enter the agitating cells with the pulp. In raising zinc the oils or reagents should be thoroughly mixed with the mineral pulp before going to the flotation cells, either by agitating in a centrifugal pump or in a mixing tank. A fine spray of oil is preferable to oil in bulk. The selection of the reagent is perhaps less important if the conditions already specified are attended to properly, but better results are obtained with certain oils by reason of their different viscosities, their sensitiveness to emulsification, or their natural tendency to wet some sulphides in preference to others. I have placed this factor last as, in my opinion, it is the least important. Broadly speaking the manipulation is more important than the reagent. I could name several oils that, under the right conditions of manipulation, will give equally good results, but some are more difficult to handle. For example, many pine-tar oils that are too thick for use where the mill-water is ice cold would give good results with warm water. Again, tar, when used for silver-lead flotation, gave good results, but on touching the cold water the tar thickened into stringy masses which clogged the pipes entering the flotation cells. I do not say that I believe one oil or reagent to be as good as another, but without proper manipulation no oil will give good results. I have found that an acid pulp is



FLOW-SHEET FOR MIXED GRAVITY AND FLOTATION TREATMENT

better for raising lead than zinc, and that a neutral or alkaline pulp is better for zinc than an acid pulp; also that a pulp rendered alkaline with soda is better than one made so with lime. This no doubt is due to the simple dehydration of the gel compounds caused by soda in contradiction to the flocculent condition produced by lime. While lime may be added to a thickener to settle the concentrate for filtration it is not beneficial if added in a thickener for flotation, although by its use a clearer overflow may be obtained. As manipulation is all important we see why the application of oil flotation to concentration fails when attention is given solely to the reagent and not to the conditions pertaining to the treatment of the pulp. The soda should be added in the form of a solid, not as a liquid. Better results are obtained this way.

Under manipulation may be included the shape or form of the collecting-chamber of the flotation machine, for the cells in any flotation system are used for two purposes, either to float a dirty concentrate, which must be cleaned before marketing, or to float a finished concentrate, which is ready for shipment. In the former case the collecting chamber of the machine should favor a quick discharge, that is, there should be a narrow chamber, but when we require a finished product the box must be sufficiently wide to allow the settlement of occluded waste or gangue. Manufacturers of flotation machines miss this point and therefore the same machine is often used for roughing and for cleaning, while the two operations require entirely different manipulation. This important structural feature in the flotation-chamber may make the difference between success and failure, for not only must a concentrate be produced, but it must attain a certain grade of metallic content to be fit for shipment. Should a concentrate be produced that is not up to the requirements for economic marketing a further concentration must be made, either in another flotation-cell or by water-concentration on tables. It is then probable that, in any scheme of flotation treatment, water-concentration may be required, with a return of the tailing to the flotation-cells. This may give encouragement to some operators who have thought the beginning and the end lay in oil concentration, without considering the use of water concentration either before or after, or both before and after, oil-flotation.

This naturally brings up the question of flow-sheets. The lead-flotation pulp may be concentrated by two different flow-systems, either by taking off the lead concentrate from two M. S. cells as clean concentrate, or by using the first cell as a rougher, and cleaning in the second cell. The second system has its advantages, but sometimes does not produce a better product than the first system. As to the zinc, the secret of low tailing with high-grade concentrate is due to the great amount of rougher-zinc slopped over the rougher-cells, and to the wide collector-box on the cleaner-cells. In my experience the rougher was worked to the full capacity of the cleaner-cells. The cleaner-cells preceded the rougher-cells, and the flotation-oils and soda were added to both the cleaner and the rougher-cells. The quantity of reagents added was a portion of the manipulation which would indicate little without taking into account the character of the ore and the grade of the feed. For the benefit of those who see a loop-hole in the 'over one-half per cent of oil' I may state that my experience leads me to believe that a non-frothing oil helps to kill a portion of the frothing-oil if the former is used in excess, that is to say, at times it may be useful instead of reducing the amount of frothing-oil to increase the amount of collecting-oil.

As regards the different reagents for the separation of galena from blende, and then concentrating the remaining zinc, in the order of their usefulness for separating the lead I place eucalyptus oil first, particularly with an acid pulp; next cresylic acid; then hardwood creosote; and lastly pine-tar oils. Eucalyptus oil can always be depended upon to give about the same results, but that is not so with cresylic acid. The cresylic acid issued by some manufacturers is of little account, so one must be careful in the selection of this reagent. By good manipulation creosote can be made to give as good results as other reagents so far as lead separation is concerned, but is not so good for raising silver sulphides. The amount of reagent for raising lead varied but little per ton of pulp from day to day, and may be taken to average about 0.07 lb. of eucalyptus oil, 0.40 lb. cresylic, and 0.40 lb. creosote per ton of pulp. Eucalyptus oil costs at least three times as much as cresylic acid, but not one-fourth as much is necessary to obtain the same or better results. It is a more sensitive reagent than cresylic acid, and must be used judiciously, for the difference of one drop per minute makes a great difference in results. The addition of crude carbolic acid to the cresylic acid made an improvement when the cresylic acid was of poor grade, but the addition of soda to either the eucalyptus oil, cresylic acid, creosote, or pine-tar oils, did not improve the lead product.

The following figures will indicate what was considered good work. With a flotation feed containing 3.6% lead, and 23.3% zinc, a lead product containing 60.8% lead and 23% zinc was obtained with cresylic acid. The best results in floating zinc were with Cleveland Cliffs No. 2 creosote and water-gas tar in the cleaner-cells and Pensacola 350 and water-gas tar in the rougher-cells. There is a great difference in the water-gas tar produced, and care must be taken in the selection of this product. While crude oil and other petroleum products answer for collectors the best results generally are obtained with water-gas tar made at St. Louis. With good manipulation and steady-running conditions, with heading assaying 3.0% lead and 23% zinc, the tailing in our mill would assay a trace in lead and 0.5% zinc. Due to faults in construction, which entailed unsteady running, the average tailing was more nearly 0.2% lead and 2% zinc. As to the silver, with flotation heading assaying 25 oz. per ton, the flotation-lead averaged over 200 oz. per ton, the flotation-zinc about 50 oz. per ton, and the tailing 2 oz. per ton.

The ore under treatment was a high-grade silver-lead-zinc ore, in which a part of the silver was intimately associated with both the lead and the zinc sulphides, and

part with gray copper. The lead and zinc were also intimately associated, which, on the whole, made the differential flotation a difficult problem. In fact, but for the feasibility of separating some of the silver from the zinc, and holding it with the lead, it is doubtful if, in this case, differential flotation was a success. The flotation heading was the tailing from water-concentration, using jigs and tables, and the flotation-zinc was re-tabled to extract what lead was possible. The lead-flotation concentrate was not re-tabled, for it was found that fine lead sulphide would float into the tailing under any condition of water-concentration. From the above observations and results we may decide that, technically, differential flotation was not much of a success, but, from a commercial viewpoint, it was eminently successful as the silver followed the lead instead of the zinc, and while the flotation-lead carried enough zinc to cause an extra smelter-penalty on the lead concentrate, the gain in silver more than offset this disadvantage.

The Rights of a Stockholder

To Examine Books of a Mining Corporation, Also to Visit Mine

[The following information was compiled in reply to a question from one of our readers. It may prove interesting to others.—Editor.]

588. Books and Balance-Sheets to be Kept by Secretary. Stockholders' Right to Inspect. It is the duty of the secretary of every corporation formed for the purpose of mining, or conducting mining in California, whether such corporation be formed and organized under the laws of the State of California or of any other State, Territory, or foreign country, to keep at some place within the State of California an office and in such office to keep a complete set of books showing all receipts and expenditures of such corporation, the sources of such receipts, and the objects of such expenditures, and also all transfers of stock. All books and papers must, at all times during business hours, be open to the inspection of any stockholder. He is entitled to be accompanied by an expert, and to make copies or extracts from any such books or papers. He may at reasonable hours, examine such mining property, accompanied by an expert, take samples, and make such other examination as he may deem necessary. . . . . All accounts, reports, and correspondence from the superintendent must be kept in some conspicuous place in the office of said company, open to the inspection of all stockholders.

589. Right of Stockholders to Visit Mine with Expert. Any stockholder of a corporation formed under the laws of this State for the purpose of mining, is entitled to visit, accompanied by his expert, and examine the mine or mines owned by such corporation, and every part thereof, at any time he may see fit; and when such stockholder applies to the president of such corporation, he must immediately cause the secretary thereof to issue and deliver to such applicant an order, under the seal of the corporation, directed to the superintendent, commanding him to show and exhibit such parts of said mine or mines as the party named in said order may desire to visit and examine. It is the duty of the superintendent, on receiving such order, to furnish such stockholder every facility for making a full and complete inspection of said mine or mines, and of the workings therein, and to accompany said stockholder either in person, or to furnish some person familiar with said mine or mines to accompany him in his visit to and through such mine or mines, and every part thereof. If the superintendent fails to obey such order, such stockholder is entitled to recover, in any court of competent jurisdiction, against the corporation, the sum of one thousand dollars and traveling expenses to and from the mine, as liquidated damages, together with costs of suit. In case of such refusal, it is the duty of the directors of the corporation forthwith to remove the officer so refusing, and thereafter he must not be employed directly or indirectly by the corporation, nor must any salary be paid to him.

590. Liability of Presidents and Directors. In case of the refusal or neglect of the president to cause to be issued by the secretary the order mentioned in section five hundred and eighty-nine, such stockholder is entitled to recover against said president the sum of one thousand dollars and costs, as provided in the last section. If the directors fail to have the reports and accounts current made and posted as provided in section five hundred and eighty-eight, they are liable, either severally or jointly, to an action by any stockholder complaining thereof, and on proof of such refusal or failure, he may recover judgment for actual damages sustained by him, with costs of suit. Each of such defaulting directors is also liable to removal for such neglect.

In the case of Hobbs v. Davis, 168 Cal. 556, it was held that a stockholder in a mining corporation is entitled to inspect the mining property of the company, and that this includes the right to be accompanied by an expert.

Similarly in the case of Hobbs v. Tom Reed Gold Mining Co., 164 Cal. 497, which was a proceeding by mandamus against a foreign mining corporation whose principal place of business was in the State of California, to enforce a stockholder's right of visitation, the court held that, under Sec. 589 Cal. Civil Code, a stockholder of a mining corporation has the right to visit and inspect the mine of the company, and that this was also true at common law.

To the same effect is Symmes v. Sierra Nevada Mining Co., 171 Cal. 427.

No licenses for the importation of amorphous graphite (plumbago) shall be issued hereafter, except such shipments as are of Canadian origin, and come overland or by lake from Canada, or of Mexican origin and come overland from Mexico. Licenses may be issued for the importation of graphite of crucible grade, when the applications therefor are otherwise in order.

High Temperature of Broken Ore

A square-set rill-stope on No. 3 level of the Bawdwin mine, of the Burma Mines, had reached the third stage. The second slice had been stoped out, and filling from the surface had been introduced through the waste-chute, until it had its natural slope of about 35°. Green lagging was then placed on the slope. Breaking had been in progress about three weeks when the stope commenced to get warm. Little attention was paid to the warming at first, as it was nothing unusual. Before long, however, it commenced to get uncomfortable for efficient work. Two days later the stope was unbearably hot, and the coolies could not work. That night the shift-boss telephoned that steam was coming out of the broken ore along the hanging wall, and he thought the timber in the stope below was on fire.

A thorough investigation took place at once. No gases could be detected, but the walls of the stope and the broken ore were hot. On scraping a couple of feet off the top of the broken ore, volumes of vapor would arise, caused by the humid tropical night-air coming in contact with the hot ore, which consists mainly of sulphides of lead and zinc. As no gases were detected, the phenomenon was immediately attributed to oxidation, and work was started to withdraw the hot broken ore. Water was also played on the ore, and on the coolies also, as the ore three feet below the original surface was too hot for their bare feet. In about 24 hours all the broken ore had been withdrawn down to the board floor resting on the fill. The following day the workings were cool.

At the upper end of the rill the ore was not over 8 ft. deep and at the bottom two or three feet deep. The longest time that any portion of it could have been in the stope would be four weeks, and this would be some of the fine that stuck to the green lagging on the floor at the top end and did not roll down the slope. At the end where the broken ore was thickest and hottest, the temperature was about 150°F. The ore below the surface had lost its bright lustre and was broken up quite fine, but other evidence of oxidation was possibly removed by the water that was thrown on it. However, the remaining ore on the hanging wall of the stope, adjacent to the broken ore, showed marked signs of rapid oxidation, especially of the zinc sulphide. The hanging wall also was coated with cobalt bloom, or erythrite, possibly the result of the following reaction:

$$\left.\begin{matrix}\text{Cobaltite, } CoAsS \\ \text{Smaltite, } (CoNi)As_2\end{matrix}\right\} + O = \underbrace{Co_3(AsO_4)8H_2O}_{\text{Erythrite}}$$

The average analyses of 19 stope-samples, taken during the actual breaking of the entire slice, and of seven grab-samples of the hot broken ore that remained in the stope at the time are as follows:

	Ag	Pb	Zn	Cu	SiO_2	Fe	CaO	Al_2O_3	S	Insol.
	Oz.	%	%	%	%	%	%	%	%	%
Stope sample...	42.8	42.2	24.4	0.4	5.4	3.5	1.5	0.7	21.3	...
Hot broken ore.	41.9	40.7	23.2	0.63	7.2	3.5	1.3	1.01	20.7	0.82

On comparison of the two averages, and on the calculation of sulphur contents in the broken ore, as required by the metals combined with the sulphur in the form of galena, zinc-blende, chalcopyrite, and pyrite, there is no appreciable decrease in the sulphur contents by oxidation.

In other stopes we have never had a similar occurrence, although we have noticed that the more broken ore in the stope, the warmer the stope. But in the past the increase in temperature had been attributed to less available air-space, as well as to slight oxidation. The ore breaks in large and small lumps in the majority of the stopes, which allows a more or less free circulation of cool air throughout the broken ore. But in this particular stope, the ore was more granular and broke very fine, giving more surface for oxidation and confining the heat, which accelerated the action. No complete chemical analysis has been made to determine the presence of any element that could act as a catalyzing agent and assist or cause such rapid oxidation, although cobalt, nickel, and arsenic are known to be present in very small quantities. The cause of such rapid oxidation is probably due to a combination of certain physical and chemical properties of the ore, all of which in this particular case happened to be present at the same time, for example: (1) the fine physical state of the broken ore; (2) the correct amount of moisture in ore and air; (3) the presence of (a) pyrite or marcasite, (b) some unknown catalyzer, (c) easily oxidized secondary sulphides and other sulphides at present unknown.

Any information from other engineers helping to explain this heating would be of great interest, not only to those in control of the mines, but to all mining engineers associated with sulphide-ore mines.—Allan B. Colquhoun, Mine Superintendent, in 'The Mining Magazine' for October 1918.

Silver Currency in China

The use of silver as currency in China began in the Sung dynasty (A. D. 960–1126), but it was made in the form of a sycee shoe, not as a coin, a practice maintained even during the later part of the Tsing dynasty (249–210 B. C.) A sycee shoe is calculated according to weight, regardless of the number of pieces, and there was no legal ratio between the tael and the cash. There are different sycee values owing to the difference in fineness, causing great confusion. For instance, there are seven different kinds of tael in Peking, and six different kinds of tael in Shanghai. Some taels, like the Shanghai, are fictitious. No Shanghai tael sycee is ever minted, but is merely used for calculations. Since the introduction of the silver coin, the use of the tael has greatly decreased. (The Kuping tael is regarded as universal because the Tsing dynasty used it in Government transactions). Since the founding of the Republic, public funds are received and disbursed in dollars (equal to Mexican pesos), not taels; but some interior places still use the tael, and even traders in Shanghai use it. It would perhaps be surprising to learn that there are no less than 65 different kinds of silver tael in China!

*Abstract from 'Far Eastern Review', September 1918.

Automatic Separation of Solution From Solids in Ore-Pulp

By BERNARD MacDONALD

*In the Parral counter-current system, agitation is effected in tanks by a number of air-lifts of comparatively small diameter through which the pulp is continuously transferred from the bottom of the tank and spouted horizontally on top of the charge. The force of the several streams thus discharged maintains a rotary flow in the charge of pulp, extending from top to bottom in the tank. This continuous transfer of pulp and the spiral flow from top to bottom maintains the constituents of the pulp in uniform proportions. The quantity of compressed air is small, as the pulp is not lifted but is simply transferred from the bottom to the top of the charge in the tank under hydrostatic balance. To further illustrate the apparatus which I use, and the explanation of the results obtained, Fig. 2, 3, 4, and 5 are submitted. These figures represent two views each of two adjoining tanks taken from the middle of any series of tanks in which the continuous treatment of pulp is being conducted. Fig. 2 and 3 show a vertical cross-section through the centre of two tanks equipped with my apparatus, along line *AA* in Fig. 4 and 5 which represent the top view of the same two tanks.

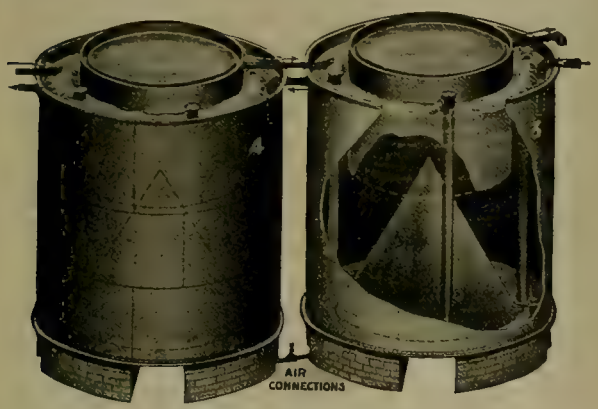


FIG. 1. COUNTER MIGRATIONS

PULP ——————→

←—————— SOLUTION

As shown in the figures, a diaphragm *C* is mounted concentrically in the upper portion of the tanks. This diaphragm is cylindrical in shape, open at the top and bottom, and is of such width and depth as required by the function it is to perform. The pulp is continuously agitated in the annular space between the diaphragm and the sides of the tank by transfer-pipes to which compressed air is conveyed through pipes *f*. At the bottom and below the lower edge of the diaphragm is the separation zone where the solids in the pulp settle by gravity and fall on the sloping sides of the zone *b* over which they gravitate to the intake ends of the transfer-pipes through which they are continuously transferred and spouted on the top of the tank-charge in the agitation circle. Above the separating-zone, the water or solution rises clear within the diaphragm, and by the hydrostatic pressure of the pulp undergoing agitation the clear solution is raised to a height above the level of the pulp commensurate with the depth of the sides of the diaphragm.

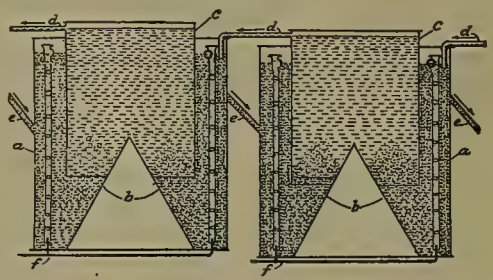

FIG. 2. FIG. 3.

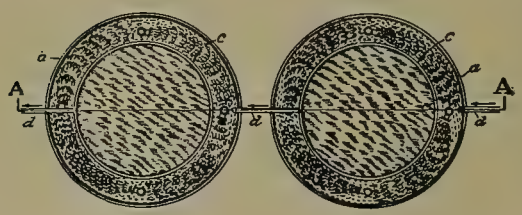

FIG. 4. FIG. 5.

As an example, if the pulp being agitated contains two parts by weight of solution to one part by weight of solids, it would have a specific gravity of, say, 1.26 (depending on the specific gravity of the solids) or, about one and one-quarter times the weight of the same volume of water. Therefore, if the sides of the diaphragm extend, for example, 9 or 10 ft. down into the pulp, the weight of the pulp would raise and balance a column of clear solution within the diaphragm to a height of more than 2 ft. above the level of the pulp in the agitation-circle. The separation of the solution from the solids takes place rapidly in the separating-zone at the foot of the diaphragm, probably due, in a considerable degree, to the centrifugal force set up by the rotary flow of the pulp in the agitating-circle. At any rate, clear solution

*Abstract Trans. American Institute of Mining Engineers.

separates from the pulp in this region and rises rapidly and continuously within the diaphragm from the top of which it is taken off through pipes *d* and delivered into the pulp being agitated in the next adjoining tank, and so on until, from the head tank of the series, the solution goes to the clarifiers to remove any fine slime that may be carried over in suspension, and thence to precipitation. The series of tanks in which the treatment is conducted is set so that each tank from first to last of the series is 6 in. below the level of the tank preceding it. This height is quite sufficient to overcome the friction from the flow of the pulp as it goes from tank to tank through pipes *e*. The last two tanks of the series may be specially arranged so that the pulp may be thickened to a high density before it is discharged to a filter-press or to the dump as conditions require. In this way, the counter-migration of the solids and solution is brought about automatically and continuously through any number of tanks equipped as shown in the illustrations. The precipitated cyanide solution which is added to the last tank of the series flows from tank to tank toward the head of the series, dissolving the metals from the solids with which it is agitated. The solution thus becomes enriched as it goes from tank to tank until it flows from the first tank for precipitation, while the solids being carried from the first to the last tank of the series become poorer until they are discharged barren from the last tank.

The same principle may be used in the acid-leaching of copper ores, but the tanks and the transfer pipes used for this purpose are made of wood in order to be acid-proof. This method obviates the use of pumps between the tanks, which give great trouble in handling acid solutions. The agitation of the pulp may be carried on within the diaphragm, leaving the annular space outside the diaphragm for the rise of the clear solution. I have designed this latter method for a plant having Pachuca tanks, but the first described method may be also installed in Pachuca tanks to advantage because the clear solution may be lifted to any height, allowing a series of tanks set on a level to be operated without pumps.

CHLORINE PROCESS IN MINTING GOLD. The Royal Mint at Ottawa, Canada, uses the Miller process for refining gold. The equipment consists of cylinders holding liquid chlorine so controlled as to give a gas-pressure of 5 to 6 lb. per sq. in., also oil-burning melting-furnaces, condensing-chambers at the rear of the furnaces and suitable pots, tongs, and molds. The gold and borax are melted in clay pots and the chlorine gas is introduced. Chlorides of gold, copper, and lead form a float on top of the liquid gold and are skimmed off. The gold ingots obtained are melted in a tilting furnace and cast in bars of 500 oz. This gold is tough and assays 995. By using the bars as anodes the fineness can be raised to 997.5 to 999.9 by the Wohlwill process. The combination of the Miller and the Wohlwill processes has the following advantages over the all-electrolytic process: (1) The loss of interest on large sums locked up during refining operations is greatly reduced, (2) the electrolyte does not become foul, as base metal is removed, (3) by using the finer anodes from the Miller process the formation of slime is reduced and any traces of platinum are recoverable from the electrolyte. The recovery of silver from the AgCl formed during chlorination is easier than its recovery from slime. The gold held by the AgCl is recovered by melting the chloride in plumbago crucibles kept at a temperature slightly above the melting-point of silver and 'salting out' the gold with sodium carbonate. After freeing the silver chloride from the gold, the fused cake is boiled in water by steam in a tank containing iron plates, the leached $CuCl_2$ being reduced to metallic copper by the iron. When free from copper, the AgCl cakes are reduced to metallic silver, washed, melted, and cast into bars. The silver produced is 999 fine and over. —R. Pearson in 'Canadian Chemical Journal.'

Iron Ore and Pig-Iron

Statistics compiled under the direction of E. F. Burchard, of the U. S. Geological Survey, show that the iron ore mined in the United States in 1917 reached a total of 75,288,851 gross tons, and exceeded the former record output of 1916 by 121,179 tons. The shipments from the mines in 1917 were 75,573,181 tons, valued at $238,260,333, a decrease in quantity of 2,297,372 tons, or 2.95%, and an increase in value of $56,358,056, or 30.98%, compared with shipments in 1916.

Iron ore was mined in 25 States in 1917 and 24 in 1916. California, Montana, and Nevada produced iron ore for metallurgic flux only; part of the output of Colorado, New Mexico, and Utah was used for smelter flux and part for pig-iron and ferro-alloys; the remaining States produced iron ore mainly for use in blast-furnaces, except small quantities used for paint from Michigan, New York, Wisconsin, and Georgia. The ore output of Minnesota, Michigan, and Alabama, the States that have for many years produced the largest quantities of iron ore, was respectively 44,595,232 tons, 17,868,601 tons, and 7,037,707 tons and was close to that of 1916, Minnesota having shown an increase of 0.02%, Michigan a decrease of 1.1%, and Alabama an increase of 4.3%. More than 1,000,000 tons of ore each was produced also by New York and Wisconsin in 1917. The Lake Superior district mined 85% of the total.

The quantity of pig-iron, exclusive of ferro-alloys, shipped or used by the producers in 1917, according to reports to the U. S. Geological Survey, amounted to 38,612,546 tons, valued at $1,053,785,975, compared with 39,126,324 tons, valued at $663,478,118 in 1916, a decrease of 1.32% in quantity and an increase of 59% in value. The average price per ton at furnaces in 1917, as reported to the Survey, was $27.29, compared with $16.96 in 1916, an increase of 61%. The production of pig-iron, including ferro-alloys, was 38,647,397 tons in 1917, compared with 39,434,797 gross tons in 1916, a decrease of 4.5%, according to figures published by the American Iron and Steel Institute, March 18, 1918.

LEADVILLE, COLORADO

General Review of Present Conditions in the District.

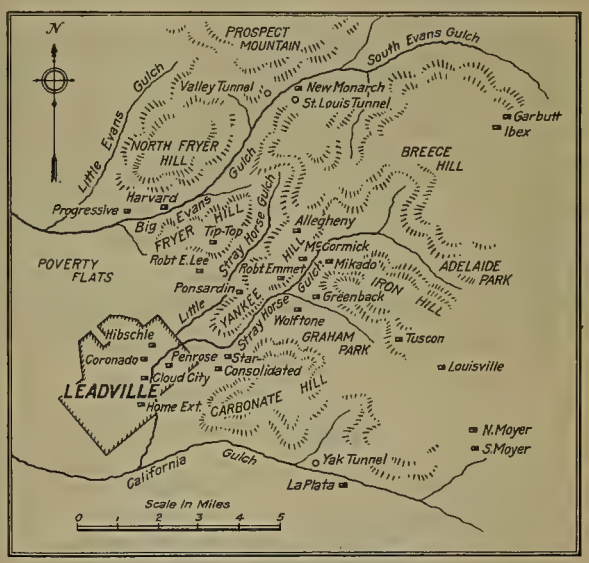
Compared with the great activity so noticeable a year ago, and the prospects for enlarged operations then in view, development in the mines of the Leadville district is now being conducted on a small scale. Two factors are mainly responsible for the present slump; the exhaustion of orebodies in a number of large properties and the shortage of labor. Under the first heading appears the closing down of three of the largest properties in the district. The Leadville Unit of the U. S. S. R. & E. Co., which had unwatered the Fryer Hill basin and carried on extensive operations through the Harvard, Jamie Lee, Tip Top, and Denver City shafts, stopped work in August, removed all of its equipment, including a fine electric pumping-plant at the Harvard, and allowed this large area to be flooded. The passing of the 'Unit' was the heaviest blow Leadville has experienced in years. It not only ended the operations of a strong and progressive company here, but it also knocked the bottom from the brightest dream among Leadville's good prospects —the dream of discovering a second contact in Fryer hill. Through all the years since the wonderful carbonate discoveries at the Matchless, Robert E. Lee, Little Pittsburg, and other famous Fryer Hill mines, Leadville had cherished the dream of another great boom when the Fryer Hill basin would be unwatered and the huge bodies of lead-silver sulphides 'known' to exist below the carbonate deposits would be opened to development. The dream apparently was about to be realized in February 1916, when the U. S. S. R. & E. Co. began work at the Harvard. Model mining equipment was quickly assembled. The shaft was drained and sinking started. Then the Jamie Lee shaft was equipped and several hundred feet added to its depth. It was not until this work had failed to cut ore or indications of ore in the lower horizon that Leadville began to despair of the undertaking; and when thousands of feet of drilling and driving proved equally unsuccessful, the hope of another Fryer Hill was reluctantly abandoned. The 'Unit' uncovered and produced a good deal of ore, but it was all encountered in the upper horizon where early-day development had been so successful. Nothing but lead porphyry and lime was encountered below, where in all the development completed not a trace of mineral was found. The company exhausted all the available orebodies in July, and by the first of August had abandoned its workings, putting nearly 100 men out of employment and leaving a barren area where it was believed the richest ground in the district would be found.

Earlier in the year, the Iron Silver Mining Co. announced that the Moyer properties, among the oldest and most productive mines in the district, were worked out and would be closed down. Shortly afterward, the company also abandoned the old Tucson mine on Iron hill, another heavy producer for 20 continuous years.

Other properties became inactive during the summer and fall. The Star Consolidated Mining Co., one of the largest producers of manganese in the State, greatly reduced operations because the market for its ore was cut off. The product was largely low grade and was being shipped to the Colorado Fuel & Iron Co. Milling difficulties caused the Mt. Champion to close, thereby stopping development in a new and promising section; and several smaller properties found it impossible to continue.

The labor shortage, while not responsible for the closing of any mine, has made it necessary for many companies to operate on a reduced basis. With influenza and pneumonia raging, conditions are steadily growing worse, and at several mines where two or three shifts have been working are now operating with one shift. It is estimated that there are 300 cases of influenza in Lake county and to date there have been 122 deaths.

Effective October 16, wages in the district were raised 50c. per day at all mines, making the minimum basis $4.50.



SKETCH OF LEADVILLE DISTRICT.

This action was taken by the operators in view of the growing scarcity of men and the impossibility of keeping a full force. Petitions circulated by the miners asking for an increase prompted the action.

To offset in some degree the loss of the recently-abandoned mines, a number of companies are making an effort to expand. The Down Town Mines Co., which successfully unwatered the Down Town basin through the Penrose shaft, and for the past year has been extracting a large tonnage of ore from the drained area, is preparing to re-open the Coronado shaft. Extensive deposits of lead, silver, copper, and manganese ores have been opened, making it possible for the company to maintain an output of 250 tons daily. The largest deposits of lead were encountered in the Otisito property at points near the Coronado shaft, and this old shaft is being put into shape for hoisting. A small electric plant has been erected for re-timbering the shaft, and will be replaced by heavier machinery when all preliminary work is completed. The Down Town company has developed its

holdings into one of the most substantial and promising enterprises in the district.

The Iron Silver Mining Co., after abandoning the Moyer and Tucson, is re-opening the Pyrenees shaft in Graham park, which will be operated in conjunction with the Mikado, the present operating centre of the company. The Pyrenees has been re-timbered and the large electric plant from the Tucson re-erected there.

The Greenback, under the management of the Western Chemical Co. of Denver, is being equipped for extensive development. New pumping and compressing machinery has been put in, and many improvements made to the hoisting equipment. Immense deposits of iron pyrite have been uncovered and a heavy output is being shipped.

The Yak Mines company has just completed unwatering the drowned Cord winze area, and is preparing to undertake new development work. Pumping equipment is being installed at the White Cap, where unwatering will be started shortly.

Among the smaller companies there is not a notable increase in activity. The C. J. Dold Mining Co., operating the Northern shaft, is branching out and will shortly re-open the Newell shaft for hoisting. Large bodies of manganese are blocked out, which is being shipped at the rate of 50 tons daily. This output will be doubled after the Newell becomes active.

The Doty Manganese Co., a new enterprise financed by Leadville people, is sinking a new shaft—the McDonald—on the S. Small property adjoining the Jason and All Right in Poverty Flats ground. The work has reached a depth of 265 ft., and will be continued to 330 ft. At this point driving will be undertaken to cut the large bodies of manganese believed to extend into the property from the Jason.

The manganese output from this district has decreased temporarily, but new work in progress at several properties is expected to result in a heavy production before the end of the year.

The Climax Molybdenum Co. closed down temporarily on October 23 to take steps toward overcoming the influenza epidemic which claimed 11 victims in 10 days. The entire workings and plant will be systematically fumigated and operations renewed at an early date.

RENO, NEVADA

Consolidated Coppermines.—Cinnabar Near Mina.—Old Orizaba Silver Mine Being Re-opened.

The Consolidated Coppermines Co. at Ely in September produced 1,196,884 lb. of copper. The mill at Kimberly recovered 79%, which is better than in August. Repair parts for pumps have been received, and the mine is being unwatered from the 1200 to the 1400-ft. level. Development at 1200 ft. in three cross-cuts is said to have exposed 9% ore at two points. Work will now proceed on the 1300-ft. level, which was flooded following the interruption to pumping. Satisfactory conditions in the Alpha ground are reported by F. H. Probert, of the University of California, who was employed by the company last spring and again in September to examine this ground. He declares the results of recent work have been encouraging, and regular shipments of high-grade oxidized ore have been maintained.

High-grade cinnabar is being opened in the Cinnabar district, a short distance east of Mina, in Mineral county. Lessees on the Keough & Pepper property have erected retorts and are shipping quicksilver, one of them at the rate of a flask daily. Three of the leases, worked by F. Elges, Tom Miles, and Al Drew, are producing and will put in more retorts. Cinnabar prospects north-east and south-west of Mina are being prospected with encouraging results.

Development of the Orizaba mine in Nye county, 36 miles north of Millers, will be resumed under the direction of J. K. Turner, consulting engineer for the Diamondfield Black Butte Mining Co., which controls the Orizaba. An examination revealed ore at a number of points, but the old workings are flooded to the 95-ft. level. In the past five years the mine has produced $23,000 in shipping ore from above this level. The obsolete steam-driven equipment, which was found inadequate to cope with the heavy flow of water, will be replaced by a modern plant, with motive power supplied by a distillate engine. Additional work will be done on the 65 and 95-ft. levels to prove the limits of the ore-channel, and a new main shaft will be sunk. An average of all Mr. Turner's samples above $9 indicated that the vein has an average width of 3½ ft., assaying $19.32 per ton, nearly all silver. Three dumps sampled contain ore valued at $44,730. The mine is an old producer of rich silver ore, chiefly from surface stopes, and its purchase has been sought by several of the large Tonopah and Goldfield companies, whose engineers have sampled it and placed a high appraisement on it.

GOLD HILL, OREGON

Gold Mining Very Dull.—Chrome Men Organize.—Manganese Deposits not Satisfactory.

Never has there been so little doing in gold mining in southern Oregon as at present. The only properties in operation in Jackson county are the Sylvanite group, three miles north of Gold Hill, and the Nellie Wright claims three miles east. Only the larger hydraulic placer mines, which are saving platinum, will operate during the coming season. All of the smaller properties have suspended during the period of the War.

Chrome producers of southern Oregon and northern California met recently at Grants Pass and organized the Oregon Chrome Producers' Association, which will affiliate with the Pacific Coast Producers' Association, organized at San Francisco last month. The operators who have been induced to develop chrome in this region on the theory that the production would be paid for at prices prevailing during the past summer have been unable to get the money back they spent. The Association is not endeavoring to protect people in the opening of new deposits, only those who are already developing.

Victor Rakowsky of Joplin, Missouri, who early in the season took options on the Manganese Metals Co.'s and adjoining manganese deposits in the Lake Creek district east of Gold Hill, after doing extensive churn-drilling, was not able to prove sufficient ore to justify his proposed 500-ton reduction works. The concentrate from the manganese ore of these deposits averages 0.10 oz. gold; 12.5 oz. silver; 1.2% iron; 53.5% manganese; and 0.16% phosphorus. About 1500 tons of ore, containing 15% manganese, is available. In addition, incomplete prospecting by drilling and open-cuts indicate that at least four acres are probably underlain by 10 ft. of 10% ore, which will yield 120,000 tons; while the surface indications on adjoining deposits will warrant an estimate of 130,000 tons additional, making a probable reserve of at least 250,0000 tons.

Manganese mining is a new industry in the Lake Creek district, actual development having been begun late in 1917. Since the first of March 1918, the Manganese Metals Co., a Tacoma, Washington, concern, has been operating a 20-ton mill on the property, producing a 45% manganese concentrate. Since this company began operations the known limits of the manganiferous area have been considerably extended by prospectors, and a large number of claims have been located. The wagon-haul from April to November to Eagle Point, the shipping-point a distance of 17 miles, costs $4 per ton. Electric power is available from a transmission-line at Eagle Point. Minimum wages are $5.

ARIZONA

Benson.—The Arizona United Mines Co., operating in the Johnson district, is shipping four cars of copper ore daily. The orebody is reported to be 160 ft. wide on the 900 and 1100-ft. levels. A. C. Harmer is general manager.

Los Conquistadores mine, 12 miles north of Benson, heretofore considered a gold producer, shows a large body of gold-silver-lead ore on Carolina No. 1 and 2 claims. This should finance considerable development. Preparations are under way to commence shipments to El Paso.

Chloride.—It is reported that a good body of ore has been opened in the Bay State mine, which is being operated by the Hughs Copper Company.

The Schuylkill Mining Co. is reported to have obtained permission from the Government to get the machinery for the new 500-ton concentrating plant. The north drift on the 900-ft. level of the Tennessee mine is said to have reached the line of the Schuylkill, and has opened a large body of lead ore. This ore is supposed to be the same shoot encountered on the 600-ft. level.

The Chloride Queen Mining Co., one mile north of the Tennessee, is driving on the orebody from the surface and is rapidly gaining depth. This drift within the last week showed indications of ore similar to that encountered in the Schuylkill and Tennessee. The orebody has widened to 18 in. and is said to run as high as $95 in silver per ton.

Constellation.—A wide body of sulphide ore, assaying 12% copper, 5 oz. silver, and $5 gold per ton is said to have been cut at a depth of 700 ft. in the old Abe Lincoln mine; while in a tunnel there is 10 ft. of 45% copper, 12 oz. silver, and $10 gold ore. This mine is on the same formation as the Monte Cristo silver mine. Charles Mathorst is superintendent. The Abe Lincoln is 13 miles east of Wickenburg, which place is much excited over these developments.

Douglas.—During October, 454 cars of ore and concentrate was shipped into the United States from Mexico through this 'port of entry' from Sonora. The estimated value placed on the ore by the Mexican government is ₱2,875,500.

Hercules.—The town of Belgravia, where is situated the mill of the Ray-Hercules company, has been re-named Hercules. A. A. Wren is general manager.

Metcalf.—Shannon produced 800,000 lb. of copper in October, the highest output since May.

Miami.—The Van Dyke Copper Co. is to sink a 1500-ft. shaft to exploit an orebody cut by drilling between 1156 and 1220 ft. The ore assayed 7% copper, and is considered to be an extension of the Miami Copper Co.'s deposit. C. W. Van Dyke is manager.

CALIFORNIA

Alleghany.—A 10-stamp mill is being erected at the Sixteen-to-One mine here. It is a plant moved from a property near Washington.

Placerville.—The old Union mine, in the Nashville district, is to be re-opened by a Los Angeles syndicate, early in 1919. D. I. Hunt will be in charge.

Portola.—No. 7 diamond-drill hole at the Walker mine is reported to have passed through 25 ft. of 5% copper ore.

Quincy.—The Feather River Gold Mining Co. is said to be constructing a four-mile ditch for hydraulicking in the spring.

Redding.—The flotation plant at the Bully Hill mine started on November 13. It cost $75,000 and has a capacity of 150 tons per day. This is the third flotation plant in Shasta county.

San Francisco.—The California State Mining Bureau has issued Preliminary Reports No. 4 and 5. The first deals with antimony, graphite, nickel, potash, strontium, and tin, and was compiled by E. S. Boalich and W. O. Castello. The other bulletin, by the same authors, covers tungsten, molybdenum, and vanadium. Those interested will find useful information on these minerals, lists of producers, and remarks by consumers.

Trinity Center.—Twenty-five auto-trucks are on the road between Trinity Center and Redding, all hauling machinery for the new Estabrook dredge at this place. Though there is 1200 tons, it is expected that the job will be completed before snow blocks traffic.

Trona.—The American Trona Corporation in 1917 made 14,730 tons of crude and 516 tons of refined potash. The total income was $1,950,154, of which $717,094 was profit. During the year, $1,014,913 was spent on plant construction; for seven months of 1918 this item was $888,804. The works erected at San Pedro, near Los Angeles, are to be removed to Searles lake. From January 1 to July 30, 1918, the output was 11,283 tons of crude and 1692 tons of other potash salts.

IDAHO

Kellogg.—The Caledonia Mining Co. will reduce its monthly dividend from 3 to 1c. per share on January 5. Development has failed to find new ore. On September 30 there was on hand $124,698 of cash, $325,000 of Liberty Bonds, $76,869 due from smelters, less current accounts of $8564, leaving $518,003 net. In the 9 months ending the above date the output was 4,449,280 lb. of lead, 510,734 oz. of silver, and 70,439 lb. of copper. After paying all charges there was a net profit of $485,443.

KANSAS

Baxter.—The Blue Mound Mining Co. is operating six drills on its leases. With the Blue Diamond company under the same control, five shafts and two mills are working. Their output last week was 250 tons of concentrate, a good deal of which receives $75 per ton.

MISSOURI

Bonne Terre.—St. Joseph Lead Co. pays 50c. per share on December 20. This is equal to $732,389.

Joplin.—Production of the Tri-State fields last week was 5438 tons of blende, 763 tons of calamine, and 1414 tons of lead. The average value was $60, $41, and $100 per ton, respectively, making a total of $551,258, and $22,438,708 for the year.

Eight smelting companies paid the agreement price of $55.67 per ton for second-grade zinc ore during the past week, though most of them were in the market for comparatively small amounts, according to the 'Globe'. A few

smelters that continued to decline to the agreement ratio on prices, paid from $50 to $52.50 for what ore they bought. Total sales were below normal by several thousand tons, as was the case a week ago. It is understood that several of the larger smelters have had much trouble with labor shortage, due to influenza. Producers are inclined to be pleased with the progress of the agreement. They point out that while demand is poor, it would have been poor under existing circumstances in any event, and the agreement appears to have saved from $2.50 to $5 per ton on ore prices in the past week, which is not insignificant. It is hoped that another week will find all smelters buying on the agreed ratio.

An appeal has been issued by the Zinc Ore Producers Committee urging producers to sell ore only to the smelters who have signed the new price agreement. The following is a statement issued by the Committee last week:

"The following smelters purchased ore last week on the new ratio scale, calling for a price of $55.67 per ton for 60% blende ore: New Jersey Zinc Co., Hegeler Zinc Corporation, Grasselli Chemical Co., American Zinc, Lead & Smelting Co., Eagle-Picher, Kusa Spelter Co., and United States Zinc Corporation. The total tonnage purchased was approximately 2400 tons, a rather disappointing total, but considering the peace talk and the probable temporary effect of peace on the zinc industry it is not surprising. It is gratifying to the committee, however, to know that all smelters who have signed the schedule are showing good faith in purchasing ore, and we trust soon to have the cooperation of the few remaining smelters who purchase ore in this district. The latter smelters bought 1300 tons of ore at from $52.50 to $55 per ton, and if this district expects to live up to the schedule adopted, it is unfair to those smelters who have signed to undersell to competitive smelters. The present war situation, we feel, is responsible for dullness of the ore market, and this situation may last for some time, and it is up to all producers to sit tight and play the fair game."

NEVADA

Virginia City.—Whitman Symmes, superintendent of the North End mines, announced on the 13th that a plan he had long favored to reduce expenses, by ceasing pumping in the lower and at present unworked levels of the Comstock, would be put into effect. All of the work is above the 2600-ft. level, and the mines will be allowed to fill up to a point somewhere below that, thus saving the cost of much pumping, which is unnecessary.

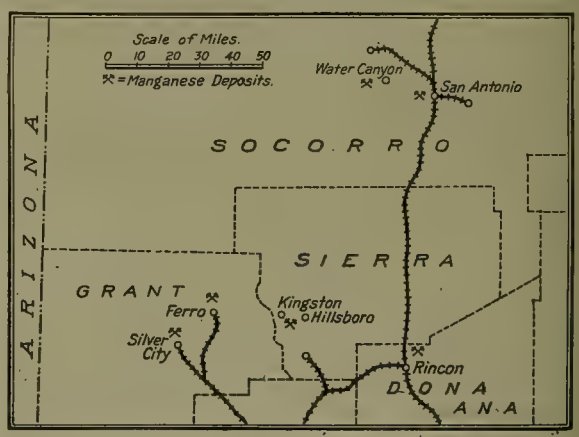
NEW MEXICO

For several years New Mexico has produced manganiferous ores from deposits in the Silver City district. In 1917 it made a small output of high-grade ore from other deposits, and in 1918 it may considerably increase its output by exploiting newly-discovered deposits and by working old silver mines for manganese ore. Many of the deposits now mined are in the west-central and south-western parts of the State, and most of them have been examined by geologists of the U. S. Geological Survey. The deposits near Fierro, in Grant county; those in the Lake Valley, Kingston, and Hillsboro districts, Sierra county; those near Rincon, Dona Ana county; and those near Water Canyon, San Acacia, Socorro, and San Antonio, Socorro county, were examined in August 1917 and July 1918 by E. L. Jones, Jr., of the Survey.

These manganese deposits occur in veins, brecciated zones, and as replacements. They may be further classified as manganiferous-silver deposits and deposits free from silver and other metals. The manganiferous-silver deposits are veins formed in fissures and replacements near fissures, both in massive Paleozoic limestone. The deposits free from silver are principally in brecciated zones and veins, but include minor replacements of wall rocks and are enclosed in Tertiary lavas and in sandstone of Tertiary or later age.

Manganiferous-silver ore occurs in two veins that cut massive Paleozoic limestone two miles north-east of Fierro. The veins are persistent and can be traced for several thousand feet along their course. The vein-matter is a mixture of iron and manganese oxides and silicified limestone, and is low grade; but it could probably be sorted or concentrated to form a marketable product. Manganese oxides are manganite and pyrolusite, but the workings have not passed through the oxidized zone so as to disclose the unoxidized manganese minerals.

The Lake Valley mine, a famous producer of silver ore in the 'eighties, at Lake Valley, the terminus of a branch line of the Santa Fe railway, promises to become an important producer of manganese ore. In the later part of 1917 the old workings were being re-opened and some shipments of selected ore were made from the old dumps. There is a large reserve of low-grade material on the dumps, and if some method of beneficiation could be economically employed the mine would yield a large quantity of ore. The ore was mined by 10 or more shafts, the deepest extending to ground-water level, which stands at a depth of 150 ft. The ore deposit consists principally of lead, zinc, and silver minerals, which are contained in a gangue of manganese and iron oxides, quartz, calcite, and silicified limestone. The silver ore shipped during one year contained, as reported by the company, an average of silver, 47.7 oz. per ton; lead, trace; zinc, 4%; silica, 28.5%; iron, 13.9%; and manganese, 18.2%. In the later part of 1917 the shipments of manganese ore sorted from the dumps ranged from 35 to 39% manganese, 12 to 15% of iron, 7 to 11% of silica, and about 0.05% of phosphorus.



MAP SHOWING MANGANESE DEPOSITS IN NEW MEXICO.

The Comstock, Lady Franklin, and Iron King mines, of the Kingston districts, are old producers of silver ores and contain low-grade manganese deposits. Most of the old workings are now inaccessible and the ore-reserves could not be estimated. The deposits are in part fillings of fissures and in part replacements of limestone. The manganese deposits in the Kingston district are too low grade and too remote from rail to be of value at present.

Near Hillsboro there are several deposits in fissures and shear-zones that cut Carboniferous limestone. The deposits are small and low grade, and the chief interest attached to them is the occurrence, in a deposit owned by Nichols & Lannon, of large well-developed crystals of the lead molyb-

date, wulfenite, and the lead vanadate, vanadinite, which are associated with soft manganese oxides.

The deposits near Rincon consist of numerous small veins that cut red sandstone and a conglomerate of volcanic pebbles. The orebodies are small, no ore-shoot having been traced more than 50 ft. along the strike of the vein, and they range in thickness from that of a knife-blade to 20 in. Their extreme depth is not known, but one vein persists to an observed depth of 20 ft., and another was reported to persist to the bottom of a shaft 66 ft. deep. The vein material consists of manganese oxides, barite, and calcite, which in places enclose fragments of wall-rock. Psilomelane is the principal manganese oxide and occurs commonly in mammillary crusts, several inches thick attached to coarse crystals of barite, and also of masses composed of nodules of various sizes. The interstices of these nodules are lined with thin films of a black-manganese oxide which has a velvety surface and which is believed to be manganite. Sorted ore from these deposits contains 45.2% manganese, 3.7% iron, 3.5% silica, 0.02% phosphorus, and 10.3% barium oxide.

Most of the deposits in Socorro county are small, and are contained in brecciated zones and narrow fissures in rhyolite and rhyolite tuff. Production from deposits of this type has been made largely from one property, that in Water Canyon, operated by Butler & Myers. From June 1917 to June 1918 this property produced 1500 tons of ore containing 40% manganese, less than 2% iron, and from 8 to 22% silica. Other deposits of this type are found near the mouth of Six Mile canyon, on the eastern slope of Socorro peak, 3 miles west of Socorro; in La Plata canyon, 10 miles west of San Acacia; and at several places in the southern foothills of the Socorro mountains 6 miles west of San Antonio.

The brecciated lava in most of these deposits is cemented with manganese oxides in seams that are too small to permit hand-sorting, but the material appears to be admirably adapted to some form of mechanical concentration. The deposit in Water Canyon, however, is contained both in rhyolite breccia and rhyolite tuff. The rhyolite breccia extends for a few feet from the surface and is underlain by a bed of tuff which is partly replaced by manganese oxides in a deposit from 2 to 8 ft. thick. The orebody terminates on the east against a northward-trending fault. Most of the brecciated zones and veins are less than 100 ft. long, and the ores will probably become exhausted at shallow depths. Psilomelane is commonly found in the outcrops of these deposits and scattered vugs in the psilomelane contain crystals of manganite. At depths of a few feet the manganese oxides are softer and pyrolusite predominates. Calcite accompanies the ore, but quartz is absent except that which is included in fragments of the country rock.

Hanover.—The Empire Zinc Co. is to enlarge its mill to 250 tons capacity.

OKLAHOMA

Picher.—Production of all districts last week amounted to 3984 tons of blende and 1086 tons of lead, valued at $397,720.

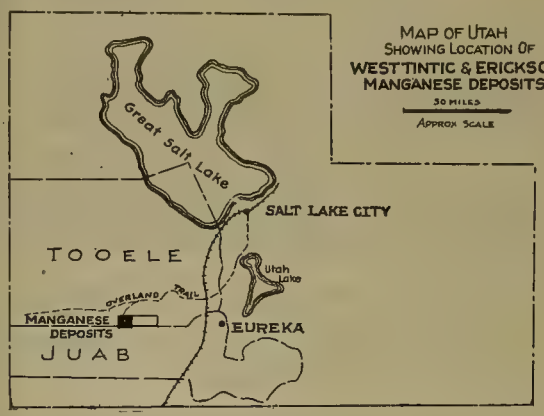
SOUTH DAKOTA

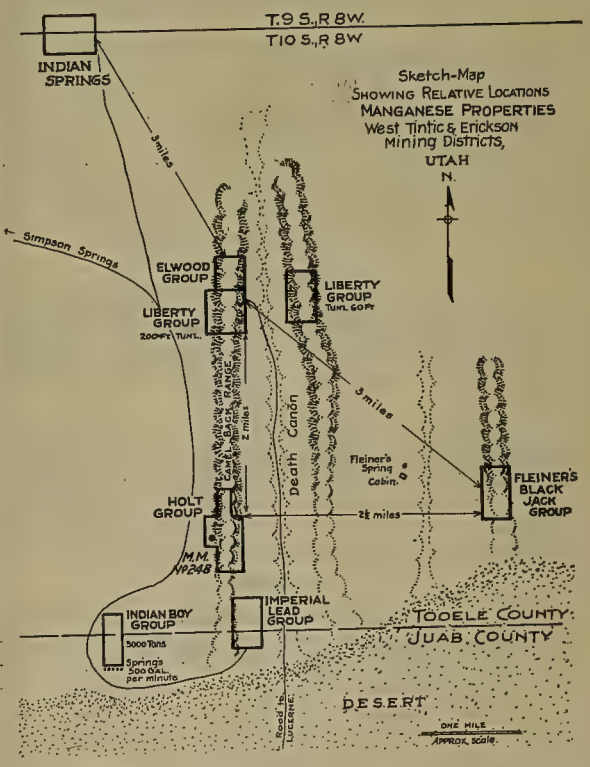
Lead.—The Homestake Mining Co. pays its monthly dividend of 50c. per share on November 20. Owing to the labor shortage the company has hung-up 100 stamps at the Mineral Point mill. This leaves 920 stamps dropping in the other five plants.

UTAH

Bingham.—The superintendent of the Montana-Bingham, J. B. Leggett, estimates that the principal copper orebody contains 1,500,000 tons of 2% material, plus a large quantity of milling ore in the Mayflower drift.

Tintic.—The accompanying maps show the location of the manganese deposits in the West Tintic and Erickson districts. An investigation was made by J. T. Pardee, of the U. S. Geological Survey, in June 1918. The Tip Top tunnel, and a mine in the Black Jack group, are together producing 450 tons monthly. If cheap haulage to rail could be secured the district could yield several times its present output.





Eureka.—The Chief Consolidated Mining Co. has issued its report for the quarter ended September 30, 1918. The net profit was $119,931. A dividend of 12½c. per share, equal to $110,528, was paid on August 3. Including a like amount on November 1, the total is $1,234,871. Current assets total $257,046, plus $433,482 in Liberty Bonds, and $399,761 cash, a total of $1,090,288. Current liabilities amount to $95,860, plus $258,588 for taxes and for No. 2 shaft. A total of 4312 ft. of work was done, including sinking No. 22 shaft 222 ft. This shaft was down 265 ft. on October 22, in porphyry, which rock may continue for

1500 ft. The shaft will be concreted the whole distance. Six prospecting drifts were put in on the 1800 and 1000-ft. levels, and 18 drifts and raises in ore-zones on the 800, 900, 1000, 1200, 1600, 1800, and 1900-ft. levels. High-grade ore was found at 1200 ft. Ore shipments were 19,436 tons, assaying 0.037 oz. gold, 30.8 oz. silver, and 10.87% lead. Manganese ore—74 tons—contained 38.15% Mn.

CANADA

British Columbia

Greenwood.—The smelter of the Canada Copper Corporation, in operation since early in 1901, is to close-down, according to an announcement by Hugh R. Van Wagenen, general manager. The news has had a depressing influence on the business men and residents of Greenwood and adjacent district, who are endeavoring through the Government and by other means to induce the management of the company to alter its policy. Mr. Van Wagenen issues a statement with reference to the decision reached which reads as follows:

"I wish to say that due to the fact that the Mother Lode mine contains now ore of a grade insufficient to meet present-day costs and because the quality of coke which is obtainable is so inferior, and because freight, wages, and supplies are all so costly under war conditions that to develop our Phoenix (B. C.) mines is inadvisable at this time, we are going to discontinue smelting operations at Greenwood and cease mining at the Mother Lode.

"For just what time this shut-down will continue is impossible to foretell. It will require a return to more nearly normal supply of labor and of costs than prevails today to encourage us to expend money necessary to lay the foundation for an operation in this district. We have much faith in our Phoenix mines and in the Lone Star, and there are encouraging prospects at two other of our properties. It is my personal belief that we will eventually re-open our Boundary operations, but I can give no assurance."

MEXICO

Cusihuiriachic.—The Compañia Minera del Mirasol has C. B. Clyne of the Mills building, El Paso, Texas, preparing plans for a 200-ton concentrating plant. E. W. Enriquez is in charge at the mines. Ore is being shipped to smelter at Chihuahua.

Coahuila

Saltillo.—The Mazapil Copper Co. is only operating at half capacity. The smelter at Concepcion del Oro in Zacatecas is producing 400 tons of 51% matte monthly. R. H. Jeffries is general manager. H. Snyman, mine superintendent for 8 years, recently arrived at El Paso, Texas.

Nuevo Leon

Monterrey.—Mining men and ore exporters in Mexico are considerably exercised over the promulgation by the constitutionalist railways of Mexico of a new and higher schedule of freight-rates on certain kinds of ore destined for export. While the new rates are upon a mileage basis, they amount practically to a horizontal increase of approximately 33%, it is claimed. As an illustration, the new rate applying between Chihuahua and El Paso, 361 kilometres, is given: The rate on first-class ore, ₱50 or upward valuation, is raised from ₱6.62 to ₱8.41 per ton, an increase of ₱1.79; on second-class ore, ₱30 to ₱50 valuation, the rate has been raised from ₱5.52 to ₱6.73 per ton, an increase of ₱1.21; third-class ore, under ₱30, ₱3.80 to ₱4.38 per ton, an increase of 58 centavos. Fourth-class ore is not mentioned. Old rates obtain as to shipments of zinc, antimony, and manganese. It is reported that an international bridge toll of ₱2 per ton will be levied in addition to the increased tariff on exported ores.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Frank L. Bosqui is in New York.

R. B. Robertson of Butte is here.

J. Power Hutchins is at the Palace hotel.

H. C. McNaught, of Denver, was here this week.

George Crerar, recently at Dayton, Nevada, is here.

Giovanni Bruscantini, of Santiago, Cuba, is in San Francisco.

R. B. Lamb has moved his office to 15 Broad street, New York.

F. M. Field has returned to Los Angeles from Virginia City, Montana.

Louis Braun is the new manager of the Winona mine at Houghton, Michigan.

E. M. Hamilton, of Hamilton, Beauchamp & Woodworth, has returned from Mexico.

Arthur Winslow is here from Boston, on his way from Oregon to Telluride, Colorado.

Henry H. Armstead has been transferred to the Corps of Engineers, U. S. Army with promotion to Major.

Fred. Hellmann and **F. S. Shaw** are making visits of inspection to the mines controlled by the Guggenheims in Mexico.

W. H. Landers, promoted to Major in the Engineers, has returned from France on special duty and is now at Washington.

J. Austen Bancroft, professor of geology in McGill University, has returned to Montreal from a geological reconnaissance at Anyox, B. C.

C. Erb Wuensch has resigned his position with the A. S. & R. Co. at Leadville and is now engaged in experimental work at Golden, Colorado.

L. R. Robins, engineer and geologist for the Tonopah Belmont company, has been promoted to the position of mine superintendent at Tonopah.

E. A. Collins, for five years Inspector of Mines for the Ontario government, has resigned to take a position with the International Nickel Company.

William Fleet Robertson, Provincial Mineralogist for the Province of British Columbia, has returned from Montreal, Quebec, where he went, under instructions, to test the cable used in the Protection shaft of the Western Fuel Co. of Canada, the breaking of which allowed a cage, loaded with miners on their way to work, to fall, carrying its passengers to instant death.

Obituary

J. J. Morrison, manager of the Empire Zinc Co., at Hanover, New Mexico, died on October 9.

Carl Evans, superintendent for the United Gold Mines Co., died from the effects of influenza on November 8.

Charles R. Van Hise, president of the University of Wisconsin, a geologist of international reputation, died at Milwaukee, on November 19 from meningitis. He was a native of Wisconsin, having been born at Fulton in 1857. He had returned only three weeks before from the European zone of war, having gone thither as a member of a mission appointed to study the problems of reconstruction. By mining engineers he was held in the warmest regard on account of his high character and his important contributions to the study of ore deposits.

THE METAL MARKET

METAL PRICES

San Francisco, November 19

Aluminum-dust, large and small lots, cents per lb.	65—70
Antimony (wholesale), cents per pound.	11.00
Copper, electrolytic, cents per pound, in carload lots.	26.00
Copper, electrolytic, cents per pound, in small quantities.	27.35
Lead, pig, cents per pound.	8.30—8.80
Platinum, Government price, per ounce.	$105
Quicksilver, per flask of 75 lb.	$120
Spelter, cents per pound.	11.00
Zinc-dust, cents per pound.	16.00

ORE PRICES

November 19

Chrome, no definite quotations available.

Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% MoS_2.	$1.25
Pyrite, per unit of sulphur, cents.	28—32
Tungsten, 60% WO_3, per unit.	$20—$26

Chrome will be found discussed on our editorial pages of this issue—also manganese.

EASTERN METAL MARKET

(By wire from New York)

November 19.—Copper and lead remain unaltered. Spelter is dull and easy.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government has fixed its maximum at 49½ pence.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, which have since been extended to January 1, 1919, prices to be effective on the day of shipment, not the day of sale. Quotations in cents per pound are as under:

A committee of copper producers and refiners agreed with the War Industries Board on November 15 to maintain the present rate of production and preserve existing levels of prices and wages. Government regulation of prices and allocation of materials will continue, the entire agreement to remain in effect until January 1, when it will be subject to renewal or revision. In making this announcement after an all-day conference, members of the committee and officials of the Board explained that the action was taken to stabilize the copper industry and those with which it is closely related during the period of transition from a war to a peace basis.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefore $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

TIN

Prices in New York, in cents per pound. The monthly averages in 1918 are nominal. Under the new international agreement, the United States is to get 66% of the world's supply of tin.

Monthly averages

	1916	1917	1918		1916	1917	1918

Tin is quoted at around 75 cents per pound.

MANGANESE

Manganese alloys: Domestic production of ferro-manganese, averaging 65 to 70% Mn, was over 35,000 gross tons in October, the largest of any month on record, according to 'The Iron Age'. This included also most of the electric-furnace output. The production of spiegeleisen in October was also over 35,000 tons, the second largest recorded month. Demand for both was almost nothing during the past week.

Eastern Metal Market

New York, November 13.

The advent of peace and its effect on both controlled and uncontrolled markets is the sole topic interfering with what little business there was in open markets. Two practically unexpected holidays in the past week, the 7th and 11th, have also been interfering factors.

Copper conditions continue unchanged for the present.

The tin market is dead, with consumers and even sellers uncertain as to its future.

The lead market is analagous strictly to the copper.

Demand for zinc is light, and quotations are nominally easier.

Antimony has again declined.

Problems of more magnitude than has ever before been experienced in re-adjustment of prices and uses of steel confront the steel trade. For the first time in its history it enters on a period of transition with the Government in practical control of both output and distribution. Some restrictions on certain lines of steel consumption have already been announced following the actual or scheduled cancellation of large quantities of war steel. Shell-steel and barbed wire contracts are the first to feel the effects of peace. A meeting is being held in Washington today between the War Industries Board and the steel committee of the American Iron and Steel Institute to confer on general re-adjustment problems. Price questions are having serious consideration, and it is generally expected that they will come down. The machine-tool trade is much concerned over efforts of buyers to cancel orders placed without conditions.

COPPER

Speculations as to the future control of the market, which apply to copper, apply also to lead and steel. Nothing definite is yet known as to the policy of the Government. Copper prices have been fixed at 26c. per lb. to January 1, and it is probable that this will hold until that date, though it is not certain. It is too early to form definite opinions. It is believed that Government control will continue for some time, and that the transition from war orders to peace will be gradual and orderly. Unquestionably the 95% of output that has been estimated as going into war work will be gradually lessened so that the famished domestic needs may be satisfied in time. When an open market will obtain no one knows, but it is certain that at 26c. per lb. profits in most cases are satisfactory. At present there is an absence of any new business, with the tone of the market easier. An authority estimates the output of refined copper at 208,800,000 lb. per month for the past 10 months of the year. Imports of copper are estimated at 47,700,000 lb. per month to November 1, with exports at 67,200,000 lb. per month. Casting copper continues easy and under the maximum at 25.50c. per pound.

TIN

Just as an international control of the tin market is being put into effect there comes the announcement of a cessation of hostilities. This has in fact added to the confusion already existing by introducing the question as to whether this new control will endure long or not or at least to what extent it will be carried out. The market is devoid of activity or interest. There has been no buying, even of small lots en route or to arrive, the quotation for spot metal standing nominal at 75c., New York. It is a matter of relief that the question of import licenses on old contracts has been cleared up, for it is now settled that importers can obtain licenses for such importations as are necessary to fill contracts which they can prove were made prior to October 1. The importers' association continues to hold meetings, and it is understood that they have an alternative plan to offer to the Government. An interesting statement has just been published to the effect that stocks in consumers' hands in this country, together with those en route as purchased, is enough to supply the country's needs for the next six to eight months. It is also a fact that the present price of 75c. is over twice what it was when the War broke out, at which time it was 34c. per lb. Total arrivals in November, to the 8th, were 1025 tons, of which 925 tons have come in at Pacific ports. The London market has declined to £327 per ton for spot Straits.

LEAD

There has been no change in the situation. Prices and distribution continue under strict control, with output well sold-up to the end of the year. Whether the decreased need of lead for munitions will affect supplies for domestic purposes is an interesting question, but there is nothing definite. Quotations, fixed by agreement, continue at 7.75c., St. Louis, or 8.05c., New York. There is a statement to the effect that Japanese firms have requested bids for lead shipments from Japan, as well as for metal made from imported ores held in this country, which they may not find it possible to ship to the Far East.

ZINC

It is believed that the Government will take all the zinc orders for November and December shipment, and that prices will not undergo any radical revision. The market is quiet with demand extremely light. Prices are nominal with nearby and November deliveries of prime Western quoted nominal at 8.40c., St. Louis, or 8.75c., New York, and December deliveries at 8.20c., St. Louis, or 8.55c., New York. For first quarter the quotation is nominal also at 7.95 to 8c., St. Louis, or 8.30 to 8.35c., New York. The Government report for the week ended November 2 shows a slight decrease in output and a decline in stocks of over 2600 tons.

The maximum Government price for grade A zinc is 12c. per lb., with that of sheet-zinc at 15c. per lb., and of plate-zinc at 14c. per pound.

ANTIMONY

The effect of a cessation of hostilities has been more marked on the antimony market than on any other. Quotations have fallen still further until wholesale lots for early delivery are held at 9.50c. per lb., New York, duty paid.

ALUMINUM

For No. 1 virgin metal and for scrap a Government maximum price of 33c. per lb. for 50-ton lots, of 33.10c. per lb. for 15 to 50-ton lots, of 33.20c. per lb. for 1 to 15-ton lots prevails until February 1, 1919.

ORES

Antimony: Again there have been no developments.

Manganese: The last quotation heard in this market was $1.15 per unit for imported ore. Consumers are awaiting developments for they know that pre-War prices were less than one-fifth of the present.

Molybdenum: The market is devoid of interest with no way to gauge market value.

Tungsten: The War has so changed future possibilities of this market that there is no demand and no way to gauge prices. It seems certain that the last levels quoted of $19 to $26 per unit could be measurably shaded were there any need to buy. The same is true of the ferro-tungsten market.

Book Reviews

Mine Tracks: Their Location and Construction. By J. McCrystle. Pp. 105, ill., index. McGraw-Hill Book Co., New York, 1918. For sale by 'Mining and Scientific Press.' Price, $1.50.

Well-laid tracks in or about a mine are of great importance, and the rapid movement of ore or other materials is expedited thereby. At small mines, the laying of tracks is generally an easy matter; but at large mines, where heavy cars and locomotives of various kinds are used, a good roadbed and heavy rails are essential. At one time, and it is still done, many companies made their own switches, etc., but they now find that standardized equipment is best purchased from specialists in the business. In the eight chapters of this practical little work we find sensible remarks on rails and joints, ties and ballast, calculation of haulage roads, grades and drainage-ditches, frogs and switches, and rules governing the upkeep of tracks. Altogether, we find this book worth a place in the engineer's library.

Bibliography of Foreign Trade Publications. By H. S. Shuey. Pp. 77. The ten Bosch Co., San Francisco, 1918. For sale by 'Mining and Scientific Press.' Price, $1.50.

The author of this work is lecturer on commerce in the University of California, and is well fitted to compile such a needed reference, especially at this time when our foreign trade is expanding. Commercial organizations have felt the need of a bibliography of publications dealing with foreign-trade subjects, so here they will find what they want. The contents, reading alphabetically, cover atlases, commercial policies and tariffs, directories, export journals, financing, foreign markets for all commodities, geography and commerce, history of international trade, house publications, insurance, magazines, publications of commercial organizations, statistics, technique, theory of international trade, transportation and trade routes, and year-books. A fair review of a book like this is difficult, as we know what an immense amount of reference has been needed, yet cannot adequately explain it; however, those that are engaged in foreign trade or are interested will find here where they can procure the particular subjects they desire to study.

Electro-Analysis. By E. F. Smith. Sixth edition. Pp. 344, ill., index. P. Blakiston's Son & Co., Philadelphia, 1918. For sale by 'Mining and Scientific Press.' Price, $2.50.

This revised and enlarged edition shows that the previous ones have been popular, and that electrolytic methods of analysis are being used more and more. At copper mines, probably more than at any other metal mines, we find electro-analytical methods used. Twenty-three pages are devoted to discussions on the rapid precipitation of metals in the electrolytic way, 117 pages to the determination of metals, and 93 pages to the separation of metals. Other special applications of the process occupy the remainder of the book, including a chapter on the combustion of organic compounds. Electro-analysis permits of clean, accurate, and rapid determinations, where ordinary methods are unsatisfactory. Necessary apparatus is well described and illustrated. Those who use electrolytic methods should find this work right up to date.

Green Book for Buyers. Fall edition, 1918. 3¼ by 7 inches. Pp. 420, index. Oil, Paint and Drug Reporter, 100 William street, New York.

From abrasives to zinkite, this useful little reference contains the names of manufacturers and larger dealers in the United States.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

LITTLE GIANT CORNER DRILLS

The Little Giant corner or close-quarter drill, manufactured by the Chicago Pneumatic Tool Co., Chicago, was designed to overcome the objection arising from the intermittent action of ratchet levers in the rotation of the spindle. In the Little Giant, steady uninterrupted revolution of the drill spindle is accomplished by means of a train of gears,

retaining all the advantages of the ratchet and permitting the drill to be used in the same narrow space, within $1\frac{7}{16}$ in. of the end wall or corner. In the Little Giant corner-drill the power of the motor is transmitted to the spindle without vibration, resulting in a steady even pull with minimum wear and tear on the machine itself. In the stub-tooth gears which are employed, the root of the gear tooth is much thicker than in the standard involute tooth. The tooth itself is shorter, hence it has a harder pull. The special alloy-steel used in these gears makes them practically indestructible.

The United States Fuel Administration has issued Bulletin No. 1 on Boiler and Furnace Testing. Copies may be obtained on application to the administrative engineer of the State in which the applicants reside, or to the Conservation Bureau of the United States Fuel Administration at Washington, D. C.

PATTERN AND TOOL PLANT SOUGHT BY LOUISVILLE, KENTUCKY

It is announced by Tampton Aubuchon, general manager, that the Million Dollar Factory Fund of Louisville has appointed a special committee composed of representatives of a number of large manufacturers of tools, dies, wood and metal patterns, with the view to establishing a tool and pattern plant in the Louisville Industrial District.

The need of a local high-class pattern and tool shop is accentuated by the unprecedented growth of fifty-nine metal-working plants in the Louisville Industrial District during the past few years.

The committee has begun negotiations with a number of large tool and pattern concerns and it is believed that the necessary arrangements for the establishment of such a plant in Louisville will be consummated at an early date.

COMMERCIAL PARAGRAPHS

'Centrifugal Pumps' is the title of a handsome 20-page catalogue (Bulletin No. 60) just off the press for the **Byron Jackson Iron Works** of San Francisco. Pumps of many designs, up to the 50-in. type with capacity of 80,000 g.p.m. under 25-ft. head, are described and illustrated. Many pipe connections, shaft couplings, valves, and other useful information is given.

Machinery, supplies, freight-rates, labor, etc., are too high these times for anyone to risk the possibilities of a small fire growing into a serious conflagration. It therefore behooves managers of all industrial plants to have large chemical fire-engines, as they are the most efficient in extinguishing fires. **Arthur R. Bird** of 311 California street, San Francisco, represents and carries a large stock of the well-known Ajax chemical fire-engine.

United Filters Corporation is moving its Eastern works and testing laboratory to its own factory building at 355 Cortland street, Belleville, New Jersey. About November 15 it will move its sales office to 65 Broadway, New York City. Hereafter all samples of material for laboratory tests and all filter parts forwarded for repairs or renewals should be shipped to the Belleville address, as given above. It will be convenient to witness laboratory tests, for the new laboratory can be reached in 40 to 45 minutes from New York.

The entry of a great metal-using concern like the **Magnolia Metal Co.** into the market as a buyer of antimony ores, is an event of importance. Between the consumer and the producer of antimony has stood an army of brokers, and the American miner has found it practically impossible to find a way to market that was not beset with difficulties and discouragements. It is a great boon to be able to deal direct with a large and responsible user of the metal. It should stimulate the development of American antimony mining. The announcement of the Magnolia Metal Co. appears in our advertising columns.

MASSCO ELECTRICAL SUPPLIES

Get this fact clearly in mind—

Massco Service to mine, mill and smelter is a complete Service.

Nothing illustrates this truth better than the Electrical Supply end of Massco Service. For instance, anything in the following list of supplies can be furnished:

Wire	Pole Line Supplies	Transformers
Insulators	St. Ry. Supplies	Meters
Conduit and Fittings	Street Fixtures	Heating Devices
Sockets, Rosettes, Plugs	Tools	Telephones
Snap Switches	Insulation	House Goods
Cutouts and Fuses	Lamps	Fixtures
Knife Switches	Motors	Shades

These are standard goods. Special catalogs, bulletins and prices furnished on request.

Crushers, Pulverizers, Clay Goods, Chemicals, Instruments, etc.

Large stocks carried in Denver, Salt Lake City and El Paso. Marcy Ball Mills—Wilfley Concentrating Tables, Headquarters for Mine, Mill and Smelter Equipment.

The Mine & Smelter Supply Company

A Service Station Within Reach of You

Denver **Salt Lake City** **El Paso**

New York Office: 42 Broadway

The Massco Giant *Typifying Worldwide Service*

RESTRICTIONS imposed on dealings in platinum have been cancelled, likewise those governing the domestic use of gold and silver for industrial purposes. We hope that the exportation of gold will be permitted shortly, because that would tend to promote the appreciation of the standard metal, thereby lowering the prices of commodities.

HOLLAND has been invaded by the Enemy in person and is beginning to feel inhospitable. Where is the Kaiser, dethroned and disgraced, welcome? We feel sorry for Holland, and also for Switzerland, which is being filled with disreputable people, from international spies to princes and grand dukes, so that the stage set among the Alps looks like a cheap cinema or an opera bouffe.

LEAD producers have been requested, by the Lead Committee of the War Industries Board, to curtail production, it being recognized that the present price of the metal cannot be maintained unless this be done. The Government has cancelled its orders for December and forward. We note that our New York correspondent refers to the unexpected stability of the zinc market.

COMPENSATION for the heart-aches of the four tragic years has come to the Allied peoples in the thrilling news of recent days. The triumphant entry of King Albert and his Queen into Brussels, the unimpeded march of the French armies under Marshals Petain and Castelnau into Metz and Strassburg, the enthusiastic reception given to General Pershing and the American troops in Luxemburg, the landing of British troops on the Gallipoli peninsula, and greatest spectacle of all, the passing of the German fleet into ignominous captivity, these are scenes that would have beggared our imagination only a month ago.

HALOS are sticky. Uneasy is the seat that fills the swivel-chair. We detect an unwillingness on the part of sundry gentlemen, recently rendered fussily important, to retire into positions of greater ease and less responsibility. We are being told, by some of them, that the era of reconstruction after the War involves problems as weighty, if not more weighty than, those that they have been helping to solve. This sounds impressive, and it is true in a measure, but we suspect the desire to remain in the lime-light, or on the movie-film, on the part of sundry minor dollar-per-annum officials whose usefulness as public regulators has been terminated by the cessation of hostilities in Europe.

HENRY FORD, it is announced, is to be an editor, having become satisfied that he can be more useful in that capacity than as a legislator, for which duty he was rejected by the voters, or as a manufacturer, in which rôle he has achieved remarkable success. Apparently he believes that the work of an editor requires no special training, but a large measure of self-confidence; having failed as a politician, he thinks that the arts of manufacture, especially those of assembling the parts of a machine in the making of vehicles of transport, will suffice to ensure his effectiveness as an editor, the Greek name for which, by the way, means one that assembles or brings together. We marvel at Mr. Ford's impudence. He should call his paper 'The Jitney'.

BY inadvertence we omitted last week to make mention of the visit paid by Mr. Sidney J. Jennings, as President of the Institute, to the local section in San Francisco. This pleasant event, on November 13, was marked by an interesting address from Mr. Jennings, followed by a discussion, to which he also contributed most agreeably. Owing to the enforced wearing of masks the audience looked like a gang of conspirators, but even that untoward restriction on good fellowship failed to spoil the occasion. Unquestionably such visits of the President of the year to the local sections—now almost an established custom, for which we owe thanks to Mr. Philip N. Moore—serve an excellent purpose in keeping the New York headquarters in proper touch with the members residing at the more distant centres of mining engineering.

CAPTAIN MAHAN would have loved to have seen the day when the German fleet under its own steam had to go to a British port in order to complete its surrender without firing a shot. When the German armies were defeated the sailors of the German navy mutinied rather than follow the example of Cervera at Santiago in 1898; they did not mutiny when ordered to kill women and children. It is said that when the German dele-

gates to the first conference for an armistice, on November 8, protested against the surrender of the fleet without the chance of battle, Sir Rosslyn Wemyss, representing the British Admiralty, said: "You had only to come out." Instead, they surrendered. After all, Jutland proved to be a Trafalgar. The Kaiser's wild boasting has become a pathetic joke. On November 21 the German fleet of 71 vessels crossed the North Sea to be received by the Grand Fleet, under Sir David Beatty, assisted by an American and a French squadron. The surrendered vessels of the Enemy passed down a lane of 400 splendid warships in two lines 15 miles long into the Firth of Forth, while their crews were sent home on transports. Even more do we rejoice in the picture of the murderous U-boats arriving off the Scottish coast to be interned and presumably to be destroyed. We do not envy their commanders and crews, who feared the resentment of the British and found themselves treated with contemptuous courtesy. They had put up a dirty fight. In order to avoid the identification of submarines that had been concerned in acts of peculiarly vile destructiveness their numbers had been deleted. The German naval flag has been pulled down and we are revenged on submarine piracy. As to the British fleet, it has been praised appropriately, just before the armistice, by our Admiral Sims, who said, that "it is the supreme and saving fact in the War." He stated also: "But for the Fleet, America, for all her wealth of men and means, would have stood impotent. It is the Fleet which after four years and more of grilling inaction holds unimpaired its high spirit and morale that has made all else in this war possible and which assures to us ultimate triumph. I say, all honor to the Fleet, which has performed its great service without the incentive of direct achievement or the stimulus of positive action." There has been both action and achievement, but the long spells of inaction has been hard to bear. The story is summarized in Admiral Beatty's signal after the surrender: "The German flag is to be hauled down at 3:57 and is not to be hoisted again without permission." Von Tirpitz is a refugee in Switzerland.

Thanksgiving

Never since the founding of these United States has there been such a Thanksgiving Day as November 28, 1918. By the time this reaches our readers the date will have passed, but the feeling of gratitude will have remained. After the Pilgrim Fathers landed on the bleak coast of New England they underwent many hardships and privations, but they persisted courageously in their pioneer work until they were rewarded by favorable seasons and happier days. Then it was that they founded this national holiday as a day of festival after the harvest and of homage to a beneficent providence. Thanksgiving Day has become to the American people much as Christmas Day to those in Europe. This year it is steeped with sentiment, national and humane. We rejoice at the ending of the War, we celebrate the vindication of Right, the triumph of democracy over military autocracy, the prospect of international peace, but most of all we thank God that America has vindicated her manhood. There is so much for which to be deeply thankful that the mind flutters from one point to the other like a butterfly over a parterre of flowers. To us it seems that most of all we ought to rejoice that our country did not stay out of the War and that her delay in entering did not make her too late to assist the defenders of liberty on whom the German onslaught first fell. We should forbear to boast in the presence of the millions of the noble dead of other nations that were sacrificed for our cause before we joined the survivors in bringing the contest to a victorious conclusion, but we may be happy in the thought that once we took a part we did it wholeheartedly and effectively. We have cause to be unreservedly glad that, when the call to arms was sounded, the diverse elements in our population responded to the national summons and that American patriotism proved itself superior to the distinctions of racial origin. We had the chance to prove an idealism that sought no material gain, a humanity above the dollars, a democracy loftier than diplomacy, and we have used these chances gloriously. Of defects and deficiencies we are conscious, of fallings short we are aware, but in the sum total of achievement we may rest content. The one government in the world that offered a serious challenge to democracy has been overthrown by its own people; civilization has conquered the most highly organized brute force that ever threatened human liberties; the laws of freedom have been vindicated to the hilt. We are proud of the valor and the conduct of our soldiers and sailors, we are grateful for the relatively small sacrifice of life that has been exacted of us, and for the enriching experience that has been granted to our sons in participating so honorably in the great events overseas. We thank God for a bountiful harvest, for our national prosperity amid world devastation, for the end of the fighting and the assurance of peace, and, last but not least, for the passing of the black plague.

The Cost of the War

The nations are counting their losses; for example, an authoritative estimate places the German casualties at 6,070,000, of whom 1,580,000 were killed and at least 1,500,000 permanently crippled. The British casualties have been announced officially as 3,049,991, of whom 685,665 were killed, and probably about 500,000 were crippled for life. The French casualties have not been published at any time since the beginning of the War, but they are likely to be not less than those of Great Britain. Altogether it may be estimated that Germany's losses in battle were about equal to those of her two chief adversaries and that the War on all its fronts involved the sacrifice of 6,000,000 lives, together with the physical wrecking of half as many more. It will be noted that most newspaper estimates are in excess of the official figures, because many names have appeared more than once in the casualty lists and the reports of losses

in battle are habitually magnified. However, to say that does not signify any desire to belittle the terrible toll exacted by the scientific and organized murder that we have been compelled to witness for more than four long years until our sensibility to horror has been calloused. For instance, our own casualties are so small, namely, 236,117, of whom 36,154 were killed, that they hardly count in the mortuary record of the War, yet the loss of those dear to us gives a frightful significance even to a total so small when compared with those of the European powers. Turning to the loss in money, it is estimated that the War has cost Great Britain already 40 billions of dollars, of which 8 billions have been loaned to her Allies and one billion to her overseas Dominions; so that the total cost before demobilization is completed will probably reach the round sum of 50 billion dollars. The cost to the German government has been 45 billions and to the French 32 billions. The United States and Austria-Hungary are estimated each to have spent 21 billions, Russia 30, and Italy 12. Adding the costs incurred by the smaller belligerents the grand total of expenditure amounts, in round figures, to 200 billions. The United States has loaned $7,732,000,000 to her Allies; during the month ended November 10 she spent $1,542,056,613. These are colossal figures but they have little significance until compared with the incomes of the nations mentioned. For example, the income of the United States is estimated at 50 billions and that of Great Britain at 17 billions per annum. The annual savings of the people of Germany and England were estimated at somewhere between 2 and 2½ billions each before the War. The loss of a year's income is unpleasant, but not serious; the loss of two years income is serious, but not fatal. Germany is bankrupt; France and Italy have been grievously crippled; Great Britain has been seriously impoverished; but the wealth of the United States has only been nicked. Apart, however, from the losses incurred by the governments of the belligerent nations, we must consider the drain made upon the financial resources of individual citizens. This has been relatively small in our country, for whereas many have suffered, voluntarily and involuntarily, others have made money, and a great deal of it, so that the citizens of the United States as a whole have little to say in the face of the sacrifice and privations incurred by the peoples that were at war for more than twice as long, particularly those whose soil became the theatre of warfare. The financial contributions made by the individual Englishman, Frenchman, or German, together with the taxation to which he responded patriotically, must represent an enormous addition to the cost of the War. It has been stated that the average British business man has been contributing three-quarters of his income in taxes, rates, and subscriptions. Thousands have let their businesses go to ruin and thousands have sacrificed their professional careers. The monetary losses involved, outside those of the governments of the European nations, stagger the imagination. The loss in life and money, in human comfort and happiness, has been appalling, and yet, now that the price has been paid, it is at least a sad satisfaction to know that right has triumphed completely and that the tyranny of militarism has been smashed utterly. The losses of our gallant Allies are great, so great as to make ours seem small, but they and we have *won!* Think what it must mean to an intelligent German or Austrian to realize how much his country and people have lost in money and life *in vain*! The generations to come in Central Europe will curse them for their hideous failure; they may realize that even for them it was best that their conspiracy of conquest should fail. On the other hand, whereas the manhood of this generation in Belgium, England, France, Italy, the United States, and the other Allied nations, has given its best in sacrifice, and mourns its loss at this moment of victorious exaltation, yet it knows that its purpose has been accomplished and that generations unborn will hallow its deeds in grateful remembrance.

Minerals Separation and the Gag

Our readers will have learned through the daily press that the Federal Trade Commission has issued a formal complaint against the various Minerals Separation companies and their associates, Beer, Sondheimer & Company, Benno Elkan, Otto Frohnknecht, and Harry Falck, all of New York, the charge being that they are combined in affiliation with German interests and that they are using unfair methods of competition aiming to monopolize the industry of separating minerals by flotation in the United States. They are further charged with attempts to prevent independent concerns from making or selling any apparatus used in flotation that is not covered by their own patents and with attempting to prevent mining companies and mine operators from using such independent apparatus. They are charged with discriminating as to the royalties they impose in an effort to discipline or punish those unfriendly to them, and with making false claims of rights in excess of those granted to them by patent. They are charged with threatening to prosecute those that are not docile to their purpose and with intimidating others by withholding licenses to use their processes and apparatus when it suits their monopolistic campaign. They are charged under the Clayton anti-trust act with making exclusive selling contracts, fixing prices, and making rebates on condition that the purchasers shall not deal with independent competitors. They are cited to appear before the Commission at Washington on December 30.

Here is the place to record the attempt of Minerals Separation to dictate to the Mining and Scientific Press. Late in July 1915 we interviewed Mr. Charles Butters on metallurgical matters, including flotation. The interview was ready for the printer when we received a call from Mr. E. H. Nutter, manager in San Francisco for the Minerals Separation company. Mr. Nutter, of course, was well known to us personally as an honorable member of the mining profession and in years gone-by he had been a valued contributor to our columns. He asked whether an article by Mr. Butters

was in our possession and thereupon stated that he had "to raise the red flag", not of Bolshevism, but of warning, proceeding to explain that he objected to the publication of the article because it did not suit the policy of his company, which was to discourage either the publication of information concerning the flotation process or the further application of the process until such time as the Supreme Court gave exclusive rights to his company. We suggested: "Until you get a cinch?", to which he acquiesced smilingly. Fortunately, Mr. Frank H. Probert, of the University of California, happens to have been present throughout the interview. Mr. Nutter insisted that his company had contracts with licensees whereby anything that might be discovered became the property of Minerals Separation and nothing could be published without their permission. Mr. Butters was a licensee. Some of the data, he said, given in the Butters interview touched on points involved in their applications for patent and as the MINING AND SCIENTIFIC PRESS was widely read in foreign countries this might lead to some quick-witted technician obtaining a patent on these points, or the article might lead to experimentation that would serve as a basis for new and competitive patents. A copy of the article was given to Mr. Nutter, as a matter of courtesy, there being no hurry to publish it, but he was informed that the article was the property of this paper, that nobody had the right to veto publication, not even the author, except as a polite concession, and that Mr. Nutter or Minerals Separation had no more right to interfere than the first man in the street, but as the Editor's aim was to be as useful to as many as possible and injurious to as few as possible Mr. Nutter could —as he wished—forward it to his chief, Dr. Gregory, at New York. The latter, in due course, sent a release, but Mr. Nutter persisted in his veto, whereupon we warned him, as a member of the profession, that he was treading upon dangerous ground. On being pressed to give a reason for his action, he said that Mr. Butters had quoted experiments on the use of chloridizing roasting for flotation concentrate previous to cyanidation, and he did not want this fact published because he, forsooth, thought of patenting this idea; whereat we exclaimed against anything so preposterous, instancing experiments we ourselves had made on the chloridizing roasting of concentrate in Arizona 23 years previously. We urged him, in a friendly way, to drop his impossible 'request' and at least to send a night-letter to Dr. Gregory before committing himself to an act that would inevitably start a bitter fight with us. He telegraphed to New York and a few days later he telephoned to say that he withdrew his objections. The article was published, in our issue of August 21, 1915, exactly as it had been written before Mr. Nutter undertook the duty of censor. We realized how narrow was the policy and how mean was the spirit of the Minerals Separation people and determined then to publish as much useful information on flotation as we could obtain. Within the following two years we published more information on the flotation process than had been published in all the technical papers in this country or abroad during the ten years preceding; in 1916, and again in 1917, we published a book on the subject. That was the sequel to the attempt of Minerals Separation to gag the MINING AND SCIENTIFIC PRESS.

The Price of Copper

The agreement made between the War Industries Board and the representatives of the copper producers to maintain the present rate of production and to continue both the existing price for the metal and the current rate of wages for the remainder of this year is of good augury. It postpones any immediate change in the status of the copper-mining industry. Announcement is made that one of the Allied governments has asked for the delivery of 200,000 tons, or 448 million pounds, of American copper. This is about equal in amount to the stock of copper in transit and unsold in this country at the present time. Domestic consumption, it is said at Washington, will require a good deal of copper to correct the shortage created by the demands of War. The resumption of automobile manufacture is a favorable factor. Reconstruction abroad should furnish a market for an enormous quantity of the metal, even after allowing for salvage from the munitions that will be scrapped as soon as peace is definitely concluded. Germany must be in urgent need of copper, in consequence of the collection of the metal from roofs, bells, utensils, and even electric equipment, during the period of the War. All this appears encouraging to the miner; but there is the other phase of the subject to be considered. The absorption of 90% of the world's output of copper by war necessities is a fact to check undue optimism. In September our exports of copper aggregated 71,220,800 pounds, as against a maximum this year of 81,058,000 pounds in January and a minimum of 42,300,000 in August. Such statistics are interesting, but the future prosperity of copper mining depends, it seems to us, mainly on the solving of the labor problem. The cost of producing copper has more than doubled during the last two years, largely owing to the higher wages paid at the mines, mills, and smelters. Of the total cost of production 60% is recorded on the payrolls of the companies. Will that be reduced soon? Will the deflation of the expenditure for labor be effected reasonably and amicably, or must it be done at the intolerable toll of disorder and riot? Here, it would seem, is room for the proper use of Government paternalism and Federal control of industry, to which mining has submitted cheerfully during the War and to which it is entitled now to turn for protection. Just as the mining companies acquiesced in the raising of the wage-scale when copper increased in its selling price, so now they have a right to expect that their employees, under Government tutelage, will acquiesce in the reduction of wages when the price falls, in obedience to economic law. This is going to be an excellent test of democratic government and we are not without hope of seeing an equitable result and a peaceful solution induced by the pressure of public opinion.

Mining in Alaska

The Editor:

Sir—The letter from your Editorial Department to our former inspector, William Maloney, was turned over to this office for answer and in such answer we must admit that the reports you have received regarding the reduced output of gold of Alaska and the Yukon Territory are too true. Alaska has been hard hit by the War and war conditions and the result has been that, owing to those conditions, many hundreds—yes thousands—of people have left the northern country for the reason that employment can be more easily obtained elsewhere at present. Owing to the increased cost of both labor and material, also supplies, many low-grade mines have suspended operations for the present and until conditions undergo a change. "Distant fields look green," and many who have gone out from the north now realize that they had better remained here, and many are returning and more will return as soon as they can arrange to do so. All the large quartz mines, including Treadwell, Alaska Juneau, Alaska Gastineau, Kennecott, Latouche, and Chichagof, are still operating but with reduced forces. For example, the Alaska Gastineau is working but 125 underground where 450 were formerly and in normal times employed.

Every mail brings to this department many letters of inquiry for positions from people who are desirous of coming north, and indications are that the close of the War will witness the greatest rush this country has seen since the Klondike discovery.

E. J. White,
Chief Alaska Bureau of Publicity.

Juneau, November 2.

Why Not Domestic Ores First?

The Editor:

Sir—As you were kind enough to find space for a previous article from me in regard to 'Prospecting Conditions in California Today', I wish you would insert these lines in your discussion columns for debate on a vital issue of the present time. I refer to the position of the producers of the so-called war metals, manganese, chrome, tungsten, vanadium, etc. As I am one of the many producing manganese, I would like to discuss the subject from the manganese producer's standpoint. During the present war there has been an enormous demand for manganese and the Government, cut off from foreign supplies, appealed to the miner and prospector to fill the want. Under this stimulus patriotic people have invested their money and opened up numerous deposits throughout the United States. It means business employment and taxes for the Government. Is this all to be a wasted energy as soon as peace is declared? Are these producers to be at the mercy of ships laden with ore as ballast from India, Brazil, etc? Is not this a system of dumping that is wholly uncalled for, or does the steel trust still maintain its lead in the Government? Why not domestic ores first? We cry, "See America first," "America first, last, and always"; then let us have fair play for those that in the time of stress and trouble gave freely, worked by day and by night, and produced the necessary raw material to beat the Hun! Why not a tariff to protect the American producer from cheaply mined foreign ores? If the Government fixed the present schedule and the steel plants made enormous profits by it, then surely they can afford to pay a price consistent with the state of things in time of peace. The same applies to chrome and other ores. So if any of your readers have a glimmer of light upon the position of the above-mentioned producers, why not 'open the ball' through your discussion columns. I, for one, would welcome it.

Leonard G. Blakemore.

Volcano, California, November 14.

War Controls

The duration and conclusion of the chief emergency activities of the Government are as follows:

Control of railroads, 21 months.

Control of telegraph and telephone lines, during the War.

Food and fuel control, end of War.

Espionage Act, end of the War.

War Trade Board and export control, end of the War.

War Finance Corporation, six months after the War, with further time for liquidating.

Capital Issues Committee, six months after the War.

Re-organization of Government bureaus under the Overman law, six months after the War.

Alien Property Custodian, end of the War, with extension of time for certain duties.

Government operation of ships, five years after the War.

Aircraft Board, six months after the War.

Agricultural stimulation, end of present emergency.

Labor employment, during present emergency.

Minerals stimulation, as soon as possible after proclamation of peace.

Federal Trade Commission v. Minerals Separation

Declaring it has reason to believe six concerns with headquarters at London, New York, and in Germany are united in a metal combination in affiliation with the great German metal interests, and are practising unfair and destructive methods of competition in the American market aimed at monopolizing the American minerals separation industry, the Federal Trade Commission today issued formal complaint against them and three of their agents. The concerns or persons named in the complaint are:

Minerals Separation, Ltd., Minerals Separation American Syndicate, Ltd., Minerals Separation American Syndicate (1913), Ltd., all of London; Beer, Sondheimer & Company, of Frankfort-on-the-Main, Germany; and Beer, Sondheimer & Company, Inc., and Minerals Separation North American Corporation, New York City; and Benno Elken, Otto Frohnknecht, and Harry Falck, of New York City.

These concerns are charged with enforcing agreements "with the intent, purpose, and effect of stifling and suppressing competition" by which they undertake to prevent independent concerns from making, selling, or leasing any apparatus, processes, paraphernalia, supplies, data, etc., used in the concentration and separation of ores, which are not covered by patent-rights controlled by the combination. They are also charged with attempting to prevent mine operators, metallurgists, engineers, and others from using any such independent commodities except with the combination's permission; and with extorting exorbitant commissions and royalties from both independent concerns and from mine owners, metallurgists, and engineers, and with compelling these latter to surrender to them all inventions which they might make in respect to apparatus for the concentration or separation of ores.

They are further charged with:

Discriminating as to royalties exacted from mine operators, between favored operators and operators whom they desire to "discipline, punish, and make examples of"; and with discriminating as to commissions exacted from independent concerns, between favored concerns and concerns whom they desire to "discipline, punish, and make examples of";

Falsely and maliciously disparaging independent commodities, independent concerns and mine operators, metallurgists, and engineers who prefer to use such independent commodities or who deal with such independent concerns;

Falsely and maliciously claiming and asserting exclusive rights, under patents and otherwise, in excess of rights actually possessed, in respect to apparatus, paraphernalia, processes, supplies, data, etc., used in the separation and concentration of ores;

Maliciously threatening to prosecute patent infringement suits against independent concerns, mine operators, metallurgists, engineers, and others for manufacturing, selling, leasing, licensing, and using independent commodities in respect to which they falsely and maliciously claim exclusive rights;

Intimidating and coercing mine operators, metallurgists, engineers, and others to refrain from using independent commodities by withholding or threatening to withhold licenses to use apparatus, processes, etc., controlled by them.

They are further charged under the Clayton anti-trust act with making exclusive purchase selling contracts, fixing prices, rebates, or discounts on the condition the purchasers shall not deal in or use the commodities of independent competitors.

The concerns and individuals are cited to appear before the Commission in Washington on December 30, 1918.

Platinum Released

On November 14 an important step toward a return to pre-war conditions in certain industries was taken by Van H. Manning, Director of the Bureau of Mines, in modifying the restrictions recently placed on the manufacture and sale of fireworks and of chemicals used in the manufacture of explosives, and on the use of platinum, iridium, and palladium in the manufacture of jewelry and for dental and other non-military purposes. Under the order as modified, licenses will no longer be required in connection with the handling of fireworks or the precious metals named. Many of the numerous chemical elements entering into the manufacture of explosives are used constantly for other commercial purposes, and under the new order no restrictions will obtain on the handling of these chemicals when not used in the manufacture of explosives. Licenses are still required for the handling of all such ingredients when intended to be used in explosives manufacture, however. The explosives regulation act was passed by Congress in October 1917 with the aim of putting a stop to the numerous incendiary explosions and fires occurring at war munitions plants and other industrial establishments. Under its terms, no one might sell, store, or use explosives or ingredients entering into their manufacture without first obtaining a license from the Director of the Bureau of Mines. The restrictions with regard to platinum, iridium, and palladium were added some months later as a means of conserving the nation's limited supplies of these metals, which were essential to the manufacture of explosives and for other war needs, but which were being extensively used in the manufacture of jewelry and for other non-essential purposes.

GOLD AND SILVER CONTENTS of the high-grade ore and ordinary concentrate produced by the Utah Copper Co. during the third quarter of 1918 was valued at $408,594. There was 3,412,700 tons of 1.2% ore dressed, so approximately the precious-metal value was 12 cents per ton.

The Utah Copper Enterprise—VI

The Mills

By T. A. RICKARD

INTRODUCTION. As soon as the mine passed from the ownership of Colonel Wall to the control of the Utah Copper Company in 1903, the company started to build a concentrator having a capacity of 300 tons at Copperton, 1½ miles below Bingham and 2 miles below the mine itself. The original plant was equipped with one No. 6 and one No. 4 Gates gyratory crushers, one coarse trommel-screen, two pairs of 26 by 15-in. and two pairs of 36 by 15-in. rolls, four fine trommel-screens, four Trent, one Janney, and one Waddell 6-ft. Chilean mills, six 3-spigot hydraulic classifiers, six 3-compartment Harz jigs, 34 Frue and 18 Johnston vanners, 48 Wilfley, two Card, and two Overstrom tables. The flow-sheet of the above equipment, as originally installed, is shown in Fig. 1.

The flow-sheet in this mill was changed from time to time (see Fig. 2), and it was on the information gained at this plant that the design of the later mill was based.

The Copperton mill started to work in August 1904. It made a 25% concentrate on a 2% ore, the recovery being slightly under 70%. The capacity was increased gradually to 1000 tons per day; meanwhile designs were

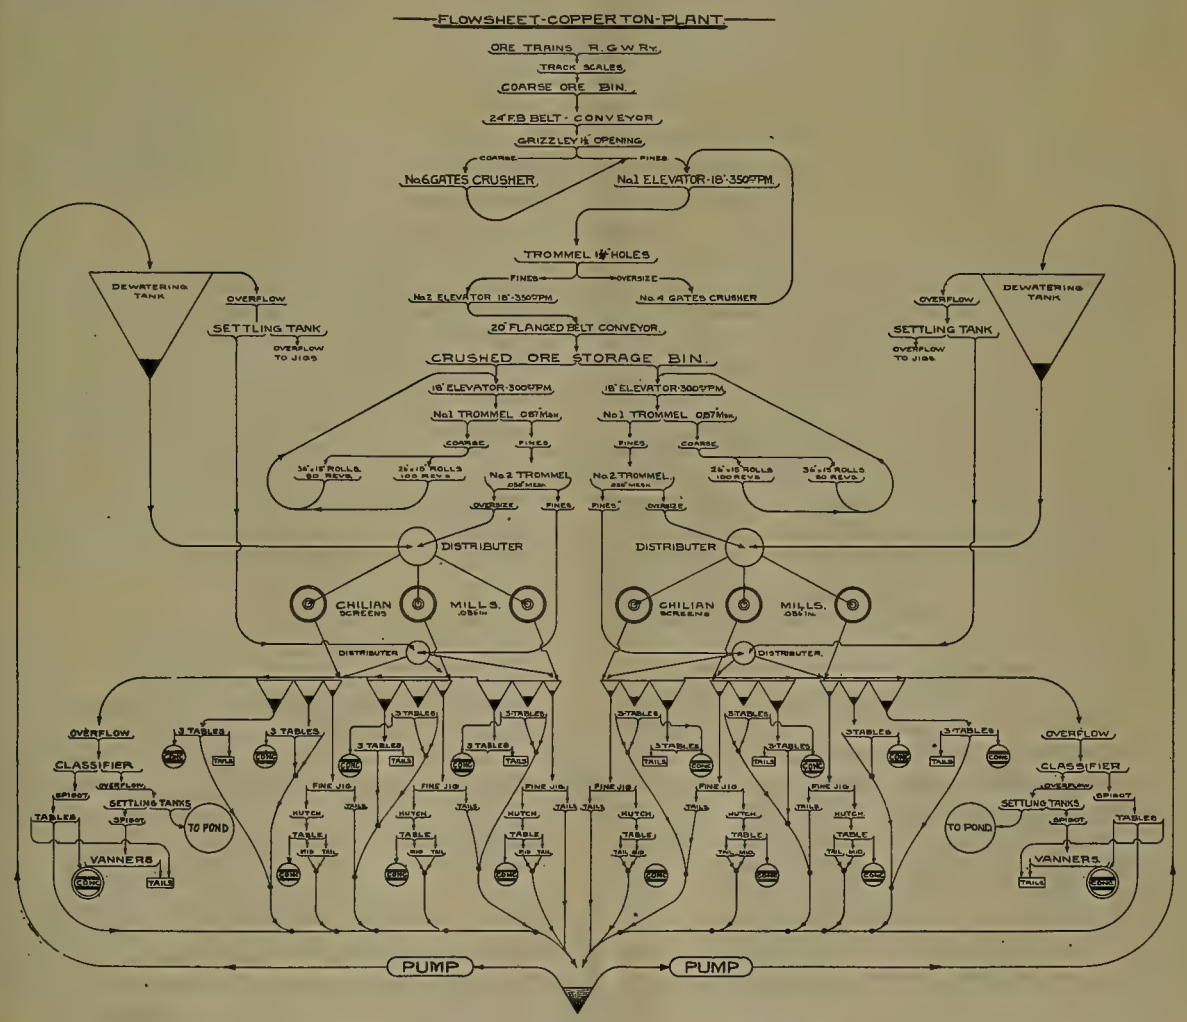

FIG. 1. THE FIRST FLOW-SHEET OF THE COPPERTON MILL

prepared for a larger mill, to be erected at Garfield, near the Lake, four miles east of the smelter belonging to the American Smelting & Refining Co. In 1905 the foundations for a plant of 3000 tons capacity were laid at Garfield, but legal difficulties with Colonel Wall delayed the building of this new mill, and in the interval the development of the mine progressed so favorably that it was decided to make this plant, called the Magna, one of 6000 tons capacity. The first section—500 tons—started to work in June 1907, and the entire mill was in operation by November 1908. By 1908 the mine had been so opened up as to furnish ample ore, but the lack of railroad facilities prevented a regular and adequate supply of ore, so that the mill treated only 77% of its rated capacity and only 55% of what it showed itself capable of treating when fully equipped. At this period the company had constructed and started to operate a power plant at Magna sufficient for the entire enterprise. This proved a great economy and advantage in many ways. The springs at Pleasant Green, near Magna, which the company had purchased from Colonel Wall and others, produced ample water for the tonnage then being treated.

These springs yield, with continuous pumping, 12,500 gal. per minute. The No. 1 pump-station is at the springs, which, to be precise, are half a mile north of Pleasant Green and close to the old Magna steam-power plant. The water is pumped to the Magna reservoir against a head of 225 ft., and to the Arthur reservoir against a head of 325 ft. During recent years the bulk of the water used in the two mills has come from the Jordan river through the Utah & Salt Lake canal, the point of diversion from the river being 5.7 miles north of Utah lake. The No. 2 pumping-station, which is at the lower end of the canal, supplies the Magna reservoir against a head of 30 ft., and from this reservoir the water is pumped to that of the Arthur plant against a head of 100 ft. The Utah Copper Company secured a right-of-way through the canal from its owners, together with the right to enlarge the canal; this work has been in hand for several years and was completed during the current year. The amount of water received through the canal varies with the seasons; any shortage is rectified by pumping from the springs. As nearly as can be determined, none of the tailing-water rejoins the source of the springs, owing probably to the fact that the fine silt in the tailing has sealed the ground. The water from the tailing-dump flows into a large settling-pond and is returned as required to the pump-sump through artificial channels. On average the milling plants use 1440 gal. per ton of ore treated. The average cost of pumping is 8.09 mills per 1000 gallons. In 1910 the company acquired the property of its neighbor, the Boston Consolidated Co.; this included not only the ore-bearing ground adjoining its own mine at Bingham, but also the Arthur mill, about a mile west from the Magna, at Garfield. The Arthur mill, of 3000 tons capacity, was designed by A. J. Bettles in 1905, and was noteworthy for including 312 Nissen stamps in its original equipment. I like to mention this fact because Peter N. Nissen has proved himself much more than a good mill-engineer. A Canadian by birth, he enlisted in the British army in October 1914 and has distinguished himself so greatly by efficiency and gallantry that he is now a D. S. O. and a Lieutenant-Colonel. The Copperton mill was closed-down on August 1, 1910, and most of its equipment of machinery was removed to the Arthur plant. In the following August the Bingham & Garfield railroad, connecting the mine to the mills, was completed by a company controlled by the Utah Copper Co. and by the end of 1912 the two big mills were in a position to treat 21,000 tons of ore per diem.

The Arthur and Magna mills were originally intended for the treatment of 3000 and 6000 tons respectively. They are now treating 16,000 and 20,000 tons. During the third quarter of 1917 they treated a total of 3,439,400 tons, or an average of 37,385 tons per diem.

These two mills stand at the foot of the Oquirrh range, facing the plain from which the Lake has retired. In the mist of morning, as I first viewed the scene, it was easy to imagine that the waters still overspread the plain, which looked like an angry sea, the streaks of saline sand fringing the stretches of marsh like the white crests of green waves.

As the two mills are much alike, except in so far as flotation forms a feature of the Arthur plant, I shall describe only the latter.

Crushing Plant. The ore arrives from the mine in trains of 40 cars. These are of the gondola type, made of steel and emptying at the bottom; on average they hold 68.15 tons wet or 63.82 tons dry. The moisture therefore is 6.35%. The ore is discharged into a primary storage-bin of 10,000 tons capacity, on the top of which grizzley-bars are placed horizontally 12 inches apart. Any pieces too large to pass are broken with sledge-hammers. Below these grizzlies are others set at an angle of 40°, the bars being made of specially rolled steel $2\frac{3}{8}$ in. apart. The oversize passes into pockets underneath, and is drawn by steel apron-feeders 48 in. wide onto a steel-pan conveyor 48 in. wide; this carries it to two No. 8 McCully gyratory crushers, each of which serves a unit, but is supplemented by a spare crusher of the same kind, available for either unit whenever required.

My description will now be confined to one of the two units into which the crushing plant is divided. The undersize from the last-mentioned grizzley drops into pockets, and is drawn from them by steel-apron feeders, 54 in. wide, onto a rubber-belt conveyor, 42 in. wide, that delivers to the first sizing-screen set at 42°, the apertures of which are varied from one to three inches by changing the screen, according to the moisture in the ore. The undersize from the screen is carried by a rubber-belt conveyor (No. 1), 36 in. wide, to the storage-bins. The oversize from the screen joins the product from the crusher, and is conveyed to a belt-bucket elevator (A) that lifts and discharges upon a second screen having apertures that are regulated in the same way as those previously mentioned, that is, in accordance with the

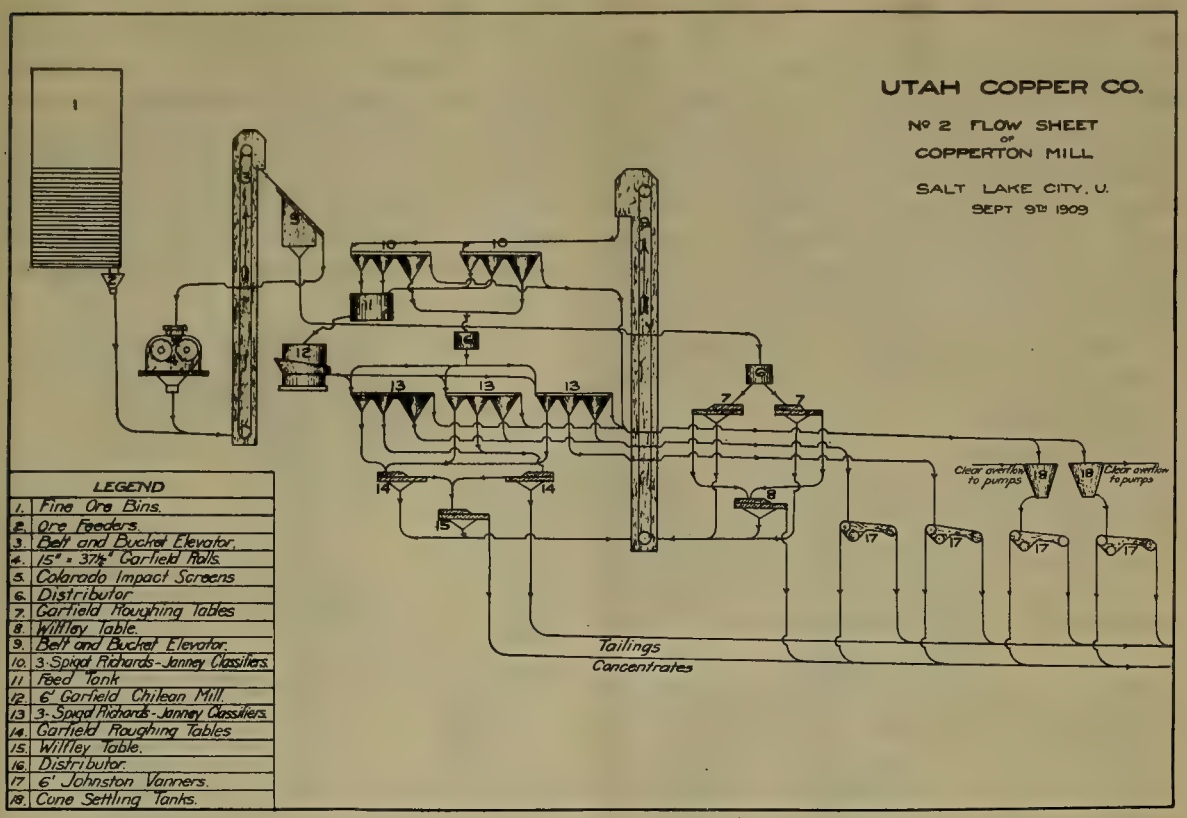

FIG. 2. THE SECOND FLOW-SHEET OF THE COPPERTON MILL

moisture. The undersize is conveyed to the storage-bins by rubber-belt conveyor No. 1, while the oversize passes to 72 by 20-in. rolls operated at 100 r.p.m. This pair of rolls is equipped with fly-wheel pulleys, the larger weighing 18 tons and the smaller 5 tons. The product discharges directly to a third wire-mesh screen set at 40°, the apertures ranging from 1 to 1½ in., according to the moisture, which varies from 5 to 13%. The undersize is carried to the conveyor that serves the preceding screens, while the oversize goes to an elevator (B), which takes it to a fourth set of similar screens. The undersize from these goes by a conveyor (No. 1) to the storage-bins, while the oversize is reduced in a second pair of 72 by 20-in. rolls operated at the same speed as the pair previously mentioned. The product of these rolls falls upon a fifth wire-screen set like the others at 40°, with apertures varying from 1 to 1½ in. The undersize goes to the storage-bins, while the oversize passes to the elevator B, which puts this material in a closed circuit with the second pair of rolls.

Already work has been started to re-model this plant in order to overcome the difficulties due to snow and ice. For three months in the winter a loss of capacity equal to 25% is caused by frost in two ways:

(1) The ore freezes in the railroad-cars, making it difficult to unload. This trouble will be overcome by the use of a car-tipple, made by the Wellman-Seaver-Morgan company, and able to overturn a car at an angle of 70°.

(2) The ore freezes in the primary storage-bins. This will be remedied by conveying the ore directly from the primary crushing plant to the secondary crushing plant without any interval of rest, so that the ore will be kept constantly in motion.

(3) The ore at the mine appears to break more coarsely in winter than in summer, causing delays in unloading. There follows an excessive breaking of ore by hand in order to admit it through the first grizzley, the one with bars 12 in. apart. This is to be overcome by the use of a No. 27 Allis-Chalmers Gates gyratory crusher, so that the new plant will include the tipple, the new gyratory, and two 60-in. rubber-belt conveyors.

(4) In addition, two pairs of 72 by 20-in. rolls will be placed in the secondary crushing plant, the idea being to avoid the use of elevators to obtain a fine reduction, namely, a ½-in. screen-aperture during the whole year, as against a 1-in. aperture in use in the summer and a 1½-in. during the winter. (See Fig. 5.)

The secondary bins receiving the product of the crushing plant have a storage capacity of 12,900 tons. Standing at the top of them the visitor may think for a moment that he has a general view of the mill, but he discovers later that he can only see a fraction of the plant, which extends for 1750 ft., as measured from the railroad-track on which the crude ore arrives to the railroad-track on which the finished product is removed to the smelter. However, one does see the floor below, on which

are the classifiers. By leaning over the rail of the ore-bin floor, one can see the Chilean mills at work, and in front of them, under the classifier-floor, are the tanks from which the Chilean mills are fed. The rest of the picture consists of suggestions of further mechanisms with which closer acquaintance will be made forthwith.

Before resuming the description of the mill-movement, or flow-sheet, it is necessary to mention the automatic sampler, which is placed at the discharge of the conveyors feeding the bins. This sampler is based on the principle of taking part of the feed part of the time. A fraction of the flow, equivalent to 1%, is diverted every five minutes. After sampling, the ore is distributed by horizontal tripper-conveyors into the various pockets feeding the sections.

The following is a screen-analysis of the product as it leaves the crushing plant:

	Percentage weight material	Accum. percentage weight material
Opening 1.050 in.	1.17	1.17
" 0.742 in.	8.44	9.61
" 0.525 in.	22.27	31.88
" 0.371 in.	16.30	48.18
3-mesh	12.11	60.29
4 "	7.24	67.53
6 "	4.07	71.60
8 "	4.27	75.87
10 "	3.61	79.48
16 "	2.82	82.30
20 "	2.31	84.61
28 "	1.92	86.53
35 "	1.74	88.27
48 "	1.55	89.82
65 "	1.53	91.35
100 "	1.27	92.62
150 "	0.82	93.44
200 "	1.07	94.51
Pass 200 "	5.49	100.00

From the bins the ore is drawn by steel-apron feeders adjustable to three rates of speed by step-pulleys, to which is attached a mechanical counter, or tachometer, registering the number of revolutions of the head pulley of the feeder, so that it is easy to adjust the proportion of tonnage passing to the 13 sections into which the mill is divided.

We now confine our attention to one of these 13 sections.

CONCENTRATORS. From the two bin-feeders of the section the ore falls upon two Colorado Iron Works shaking-impact screens, 3 by 4 ft., set at an angle of 34°. The undersize, to which water is added, flows to 12 Garfield roughing-tables, these being modified Wilfleys with riffles extending the full length of the deck. The oversize from the impact-screens goes to two pairs of 15 by 37½-in. Garfield rolls of the movable pedestal type, the product from these passing to a bucket-elevator that lifts onto four impact-screens 3 by 4 ft. each, set at an angle of 34°. The undersize, to which water is added, from these screens joins the undersize from the previous screens, while the oversize is returned to the rolls, which puts the material in a closed circuit with the four impact-screens and the two pairs of rolls. The screen-mesh is varied between 6 and 10, depending upon the character of the ore and its moisture.

Various kinds of jigs were tried in the Copperton mill, including those of the Harz type, which was adopted, with trommels, when planning the original flow-sheet of the Magna mill. Later, the Garfield roughing-table was developed, and it proved to be more efficient than the jig, owing to the fineness of the mineral liberated by the crushing and the low ratio of concentration. At the time the Copperton mill was designed, the trommel-screen was in general use in the West and the impact-screen had not as yet been developed satisfactorily; when, at a later date, it was tried in the Magna mill, it proved to be more efficient and economical than the trommel. For these reasons the Garfield roughing-table and the impact-screen were substituted for the jig and

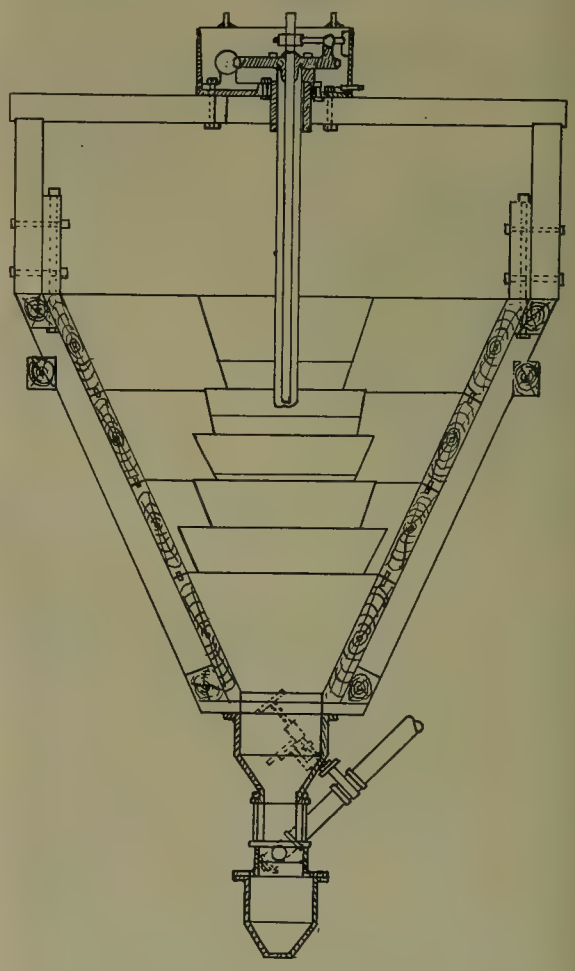

FIG. 3. THE RICHARDS-JANNEY CLASSIFIER

trommel as soon as the Copperton mill was overhauled and remodeled; but before these changes had been made in the Copperton plant the Magna mill had been equipped entirely with roughing-tables and impact-screens, and the same practice was adopted subsequently in the Arthur mill.

In one of the sections, I noted a Tyler vibrating screen. This screen is caused to vibrate by means of two hammers that strike pins in the centre of the screen. It is used as an experiment.

Now all the pulp is wet. Reverting to the roughing-tables, these produce a low-grade concentrate containing

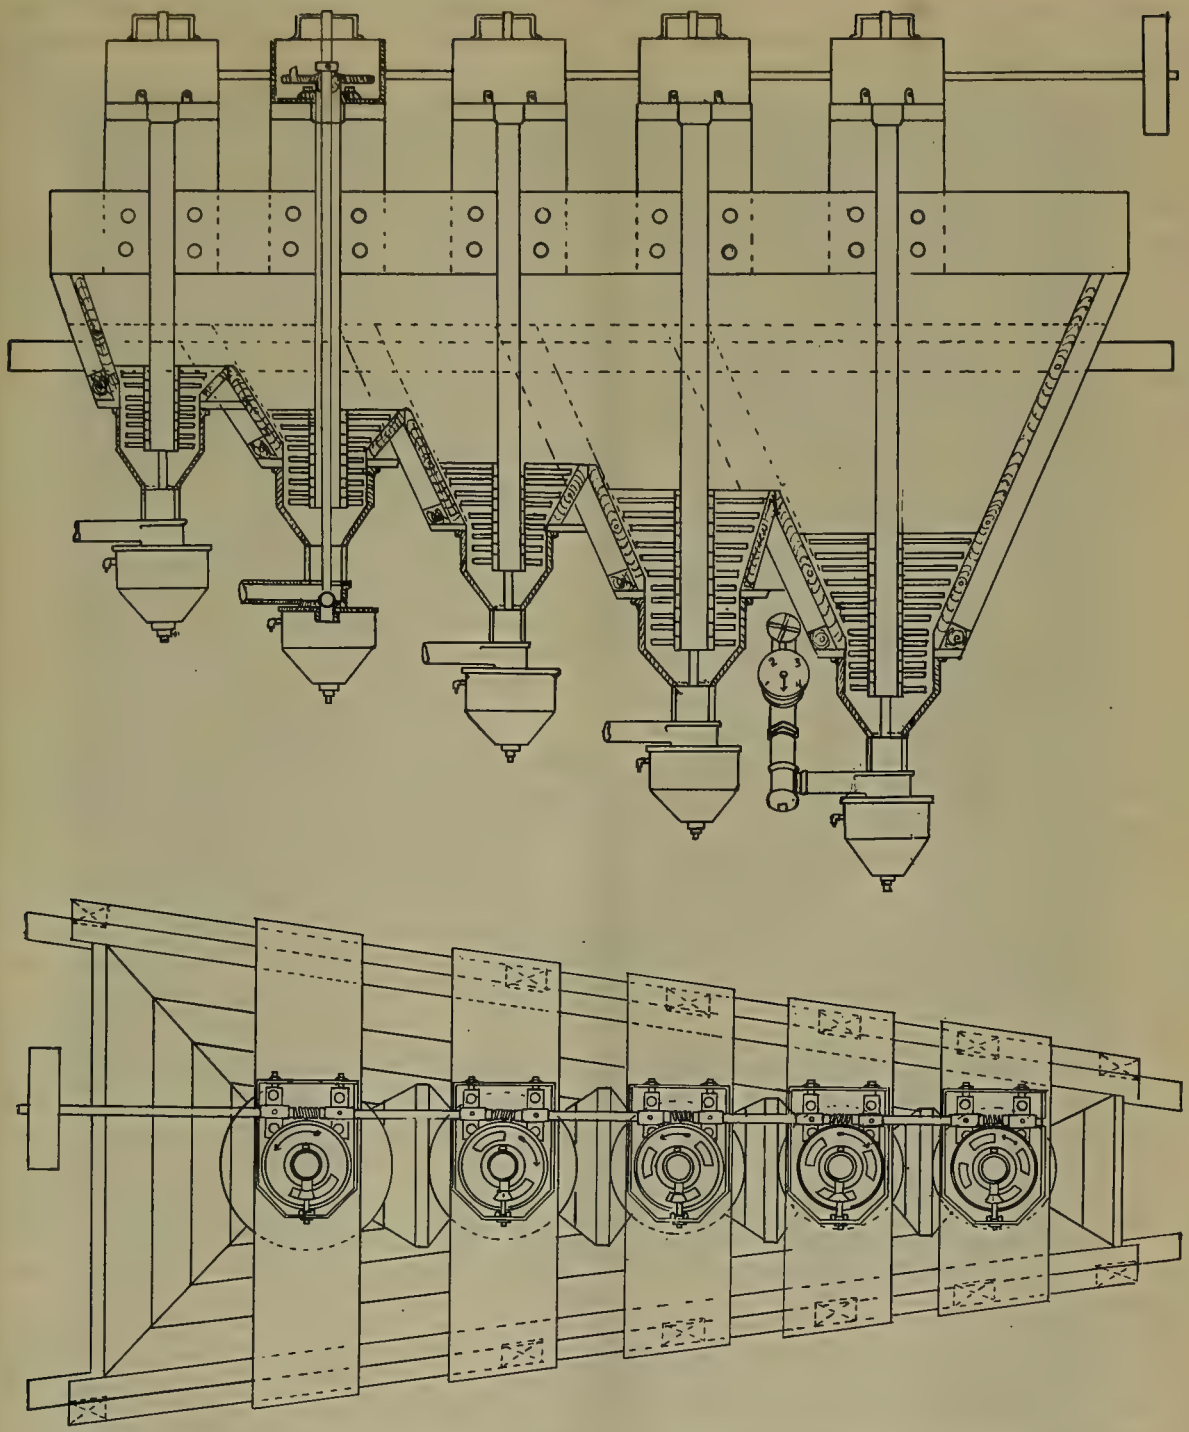

FIG. 4. PLAN AND SECTION OF THE RICHARDS-JANNEY CLASSIFIER AS USED IN THE ARTHUR MILL

all the coarse mineral as liberated by the precedent crushing. This concentrate is re-concentrated on four No. 5 Wilfley tables placed on the floor above the roughing-tables, the conveying being done by a bucket-elevator. The Wilfley tables yield three products: concentrate (the first finished product in the mill), middling, and tailing. The roughing-tables yield only middling and tailing. The middling from the Wilfley tables is returned to the elevator, which puts it in a closed circuit with the Wilfley tables.

Looking at the Wilfley tables, I noticed that the pyrite and chalcopyrite hide the finer chalcocite, so that the

heading is distinctly pyritic. It does not look like the product from a chalcocite ore. The coarse pyrite forms the top fringe, and includes large grains of chalcocite; then comes the chalcopyrite, with the finer iron pyrite and some of the fine chalcocite. On one table I noted a fringe of fine chalcocite behind the chalcopyrite. The inclination of all the tables, Garfield and Wilfley, is fixed.

The Wilfley concentrate (to which water is added) flows in a launder to the filter plant, while the tailing joins the roughing-tailing, so that united they flow to a 30-in. bucket-elevator discharging into four primary 4-compartment Richards-Janney classifiers. The first and second spigots of the classifiers feed the Chilean mills, the third feeds the tube-mills, the fourth feeds the secondary classifiers, while the overflow goes to the slime-flotation plant. The primary classifiers appear to play a highly important part, but F. G. Janney, Jr., the General Superintendent, informs me that it is intended to replace them with drag-classifiers, because close classification is not essential now that flotation supplements the water-concentrating method, for the reason that the making of slime is no longer a drawback to the successful recovery of the copper sulphide.

THE RICHARDS-JANNEY CLASSIFIER was designed by the late Frank G. Janney, Manager of Mills for the mining companies under Mr. Jackling's direction; it embodies the Richards hindered-settling principle with the practical features of intermittent discharge, retardation of flow, controlled settling, and hydraulic regulation. In classification two general principles are involved, namely, free settling and hindered settling, respectively, according to the action of the material in the settling-column. In free settling, the action takes place in a column so designed as to present a uniform cross-section and consequent constantly rising current of water, so that the particles of material are allowed to settle against the specific gravity of the water alone.

The hindered-settling action, on the other hand, is caused by constriction in the classifying column, causing a difference in the velocity of the water in this constricted cross-section; which results in the formation of a zone of material of increased density in that portion of the column where the water-velocity is lower. This zone consists of particles that settle against the slowly rising flow in the larger column, but will not descend against the rapid flow in the constricted section. This zone of material changes the general density of the settling-medium, and raises the sorting efficiency. Greater success has been attained by hindered settling than by free settling, because the former assists the concentrating machine by furnishing a feed properly sorted according to mass.

When the Magna mill was re-modeled, 76 of the Richards-Janney classifiers were installed as part of the regular equipment. The result was an immediate increase of mill-capacity, together with a decrease in the cost of milling, and an increased recovery. These machines are also a part of the equipment of the mills operated by the Ray Consolidated and Chino Copper companies, in which the use of them has proved similarly advantageous.

The points to be emphasized in the design of a hydraulic classifier are close hindered-settling classification, low water-consumption, flexibility in capacity, non-dilution of slime, low cost of maintenance, and adaptability to change of load. As will be seen from the following description, these objects have been attained in large measure in the Richards-Janney machine.

The classifier consists of a series of rectangular compartments increasing in size and stepping down from the free end, the lower part of each compartment constituting the settling-chamber. A cylindrical sorting-chamber and hydraulic chamber are attached to the bottom of each compartment, the hydraulic chamber being in the form of a tee of rectangular section. The hydraulic inlet is governed by a gate-valve, and the bottom of the hydraulic chamber has a flanged end tapped to receive the inner valve-seat bushing. Attached to this flanged end is the retarding-chamber, provided with an air-cock and tapped at the apex to receive the outer bushing. The feed-inlet and overflow-outlet are a few inches below the top of the sideboard, which extends along the top of the classifier for its full length. A cast-iron box with housing for the driving mechanism is supported above each compartment, the bearing for the spindle extending downward from the base of this box through the supporting frame. This spindle reaches downward into the centre of the sorting-chamber, and carries a series of sorting-blades driven through worm-wheels. Intermittent raising and lowering of the valve-rod are effected by means of cams attached to the worm-wheel. The valve-rod, which extends through the hollow spindle, is fitted at the lower end with a rubber valve, which sits on the inner bushing in the hydraulic chamber, as shown in Fig. 3 and 4. An arm fitted to the upper end of the valve-rod, and engaging with the cams on the worm-wheel, opens and closes the discharge-valve.

When in operation, the shaft revolves at about 80 to 90 r.p.m. Upon the feed entering the classifier the sorting-blades turn and loosen the pulp, without any raising or lowering action. The valve-rod is raised by the cam, opening the valve, which permits the material to pass through the inner bushing into the retarding-chamber. This chamber fills with sand and the valve-rod drops, closing the inner bushing. The material flows from the retarding-chamber through the outer bushing, and when the chamber is empty the classifier is ready for the next cycle.

Some of the main features of this classifier are close classification, economy of water, which ranges from 200 to 500 gal. per ton of ore, and large capacity. The standard 5-compartment classifier, from actual mill-tests, treats as much as 750 dry tons of ore per 24 hours, on material up to 7 mm. in size.

STAGE-GRINDING. Each section of the mill contains two Chilean mills, of 6-ft. diameter and of the Garfield type, the mullers making the circuit at the rate of 33½ per minute, and discharging through a No. 89 Tyler Ton-Cap screen having long narrow slots equivalent to 14 mesh. These grinding-machines are fed from equalizing-tanks, that is, storage-tanks intended to overcome the effects of

a variable feed. The product from the Chilean mill joins the rolls-product and goes to the roughing-tables, forming a closed circuit with the primary Richards-Janney classifiers.

The two drag-classifiers, which are fed from the third spigot of the Richards-Janney classifiers, are of the Dorr, or interrupted eccentric, type. Each of them delivers to a tube-mill, 7 ft. diam. by 10 ft. long, also home-made, and differing from other types in being equipped with ring-liners that are self-locking, thereby obviating the use of bolts. The absence of bolts is noticed by the visitor, but the chief feature is a shell that does not leak. Not only is the nuisance of loose liners avoided, but, it is claimed, an increase of grinding efficiency is caused by the anvil action afforded by the solidity of the lining. Each tube grinds 350 tons in 24 hours, the reduction being such that the proportion of material larger than 48-mesh in the general mill-tailing has been lowered from 35 to 10%.

In some of the mills Californian beach-pebbles of No. 3 and No. 4 size are used as a grinding medium; in others, Adamant cubes; and in others, Manganoid steel balls. The average consumption of the Californian pebbles is 3.16, of the Adamant cubes 2.03, and of the Manganoid balls 1.23, pounds per ton of material passing through the mill. The horse-power is 61.3 for the mills using the Californian pebbles, 60.09 for those using Adamant cubes, and 142 for those using Manganoid steel balls.

The product from the tubes returns to the elevator that lifts the tailings from the roughing and Wilfley tables, and returns with them to the primary Richards-Janney classifiers, establishing a closed circuit. The overflow from the drag-classifiers feeding the tube-mills joins the overflows from the primary and secondary classifiers, going with them to the thickening-tanks that supply the slime-flotation plant.

VANNERS. The product from the fourth spigot of the primary classifiers passes to four secondary 5-spigot classifiers, also of the Richards-Janney type, where it is further classified by hindered settling so as to yield five products, each of which goes to a group of Isbell and Johnston vanners, thus:

First spigot to 8 Isbell vanners
Second spigot to 8 Isbell vanners
Third spigot to 8 Johnston vanners
Fourth spigot to 8 Johnston vanners
Fifth spigot to 8 Isbell vanners.

These vanners are provided with corrugated belts, 6 ft. wide and 10 ft. long; the Isbell is operated at a speed of 176 side-shakes of 1-in. amplitude per minute, and the Johnston at a speed of 132 side-shakes of 2-in. amplitude per minute. The slope of the vanner is 7° from horizontal.

The travel of the belt varies from 60 to 120 in. per minute. The belts seem to give remarkably good service; one that I noticed had been in use for over two years, and yet the corrugations were perfectly sharp. This belt was made by the Republic Rubber Co., I was informed.

The vanner-tailing goes to waste, this being the first waste-product to be recorded. The concentrate is collected in a box and flushed with fresh water at intervals so as to push it into an elevator that lifts it to two hydraulic classifiers, each of five spigots, the products of the first four spigots of each classifier going to two Wilfley tables, while the product from the fifth, with the overflow, goes to Dorr thickening-tanks and thence to the flotation re-treatment plant. This subsidiary table-concentration plant, therefore, consists of eight Wilfley tables, each of which has a corresponding vanner. Each of the Wilfley tables produces a finished concentrate, a middling, and a tailing; the middling is returned to the elevator, and is in a closed circuit with the classifiers and Wilfley tables, while the tailing is re-concentrated on its corresponding vanner, which in turn yields a middling that is returned to the elevator and is in a closed circuit, while the tailing goes to waste. The overflow from this last set of classifiers, with the product from their fifth spigot, goes to flotation, as I have stated, so that the water-concentrating operations end here.

On the first vanner-floor one detects the aromatic smell of flotation-oil; this becomes more intense as the flotation cells are approached, until in the midst of the flotation annex it has a lachrymose effect on the eyes. The spread of vanners on the lower floor is impressive owing to its extent, but I noticed that 20 out of 60 vanners in each section were idle, the slime that formerly went to them being now subjected to flotation, because as yet these vanners have not been equipped, as they will be, with the corrugated belts required to enable them to treat the sandy portion of the pulp. All the wooden vanner-floors have been propped, the ground underneath having been excavated previous to replacing it with concrete.

A laudable effort is being made at the two mills to erect attractive office-buildings and houses for members of the staff. The lawn and trees are pleasing to the eye, and must be much appreciated during the hot summer. A club-house and dormitory are to be erected at Magna, the dormitory to be open not only to the unmarried members of the staff but to any men of decent habits. In the centre of the group of buildings is a fountain erected as a memorial to Frank G. Janney. It reads:

In Memoriam

1866 F. G. JANNEY 1916

Manager of Mills

This memorial erected by the employees of the Magna Plant in recognition of his impartial leadership and as a token of their undying esteem.

To live in hearts we leave behind is not to die.

Dedicated May 12, 1917.

This is a thoroughly American tribute to a good worker and captain of workers. The man so memorialized has left not only an honorable memory, but two worthy sons, Frank G. Janney, Jr., and T. A. Janney, the elder being now general superintendent of both mills and the younger the superintendent of the Arthur plant.

(To be Continued)

The Decisive Battle of the War

By FRANK H. SIMONDS

[The following description of the Battle of the Hindenburg Line by Frank H. Simonds is one of the memorable writings of the War. Our readers will be glad to have it, even if they have read it before. By those to whom it comes fresh, it will be appreciated. We are enabled to print it by courtesy of Mr. Simonds himself and of the New York 'Tribune'. The map has been specially prepared for the purpose.—EDITOR.]

This battle, for which, perhaps, the name of the Hindenburg line, the geographical objective which was attained and passed, supplies the best title, extended over a front twice as extensive as that of the First Marne, hitherto the greatest in history; it was fought by not less than 4,000,000 men; it was immediately followed by the evacuation of more than 7000 square miles of French and Belgian territory, and a retreat as unmistakable and perhaps to prove as extended as that of Napoleon after Leipsic.

In this battle, in the larger sense, there was no geographical objective. The immediate obstacle before Foch was the Hindenburg line, which had to be broken, but the ultimate objective behind the line was the German army, which is not yet routed when these lines are written, but has been beaten unmistakably, and beaten in such fashion that the fact of Allied triumph is no longer denied in Berlin. Napoleon's problem after Leipsic is Germany's problem now, after the Battle of the Hindenburg Line; it is the problem of preventing the invasion of the home land and the overturn of the dynasty. Napoleon failed to solve his problem and was driven to abdication and exile; the task before William II is not lighter.

The Battle of the Hindenburg Line opened on September 26. On that date the Germans between the sea and the Meuse were substantially on the ground which they had occupied at the beginning of their offensive on March 21. Only west and north of Lille and south of Laon did they hold any valuable ground which had not been in their hands in the spring, while only east of Cambrai had they lost any important positions, likewise in their hands in March.

On all this front of nearly 200 miles the Germans stood behind a system of defence which had been elaborated over two and in some places over four years. They possessed all the points of vantage, and from Arras to Soissons they had before them that desert created by the famous Hindenburg retreat of 1917, which challenged the best efforts of Allied engineers to construct lines of communication for their advancing armies. Behind the Germans was an undevastated country with lines of communication developed during four years of occupation.

Between March 21 and September 26 the Germans had tried and failed to win the War by a colossal offensive. Their failure had cost them many prisoners and many guns, but they had not yet lost more prisoners or more guns than they had taken in the successful phase of their offensive. It may even be doubted if their total losses were much greater than those of their foe, although their practice of selecting the best elements in their armies and grouping them in storm units had exposed them to much heavier losses on their best material.

All things considered, the Germans stood in much the same position in which they had in previous years beaten off Allied offensive, notably at the Somme in 1916 and at the Aisne and in Flanders in 1917. Their problem was to make the Allied advance so slow and so costly that it would achieve no material results before bad weather ended the campaign and gave their diplomacy the opportunity, using the military deadlock as the basis for argument, to seek a negotiated peace based upon the idea that no military decision was possible. In this contest the Germans were outnumbered and outgunned, but not in any overwhelming degree. They had just as good a chance to win a defensive victory, so far as surface conditions were concerned, as they had in the three previous years.

The task of Foch was equally simple, but of unexampled magnitude. He had, in the few remaining weeks of the campaigning season, to break the German line, to force the German armies back over the whole front and to inflict upon them such a defeat as would abolish all question of the impossibility of a military decision and demonstrate that the War could be won by arms, and that therefore there was left to the Germans only the choice between immediate surrender and the persistence in a war which could have but one end, and would before that end came, bring the invasion of Germany itself.

Given the magnitude of the numbers involved and the extent of the front, there was small chance that Foch could achieve a Sedan, or even a Waterloo, unless there should be a sudden collapse of German morale, such as was not forecast by any recent event, and did not, as the event proved, occur during the course of the actual battle itself. What he had to do was to inflict a decisive defeat, which would once and for all put an end to the idea that a war of positions would have no other termination than a deadlock. He had to win such a victory as to prove that an old-fashioned decisive military triumph could occur even in contemporary warfare.

In sum, he had to do exactly what the allied commanders fighting Napoleon had to do—he had to defeat his antagonist in such fashion as to demonstrate that

ultimate and irrevocable defeat for the great foe was neither impossible nor improbable. He had to break the legend of the invincible German machine, now on the defensive, as the allies of 1813 had to break the Napoleonic legend. This, all of it, he did accomplish between September 26 and October 15. In that time the whole opinion of the civilized world, Teutonic and non-Teutonic, was brought to the common point of recognition that Germany had lost the War irrevocably, and all that could occur in the future would be the victorious exploitation of the Battle of the Hindenburg Line.

In solving his grandiose tactical problem, Foch opened his battle on the flanks, reserving his main thrust for the centre and for the appropriate moment. Thus, on September 26, it was Liggett's First American Army, in conjunction with Gouraud's Fourth French Army, which delivered the blow on the German left, while King Albert's Belgian Army and Plumer's Second British Army delivered the blow on the German right.

The Franco-American blow resulted in a swift advance by the Americans north of Verdun, the capture of Montfaucon and a dozen other towns and villages on the west bank of the Meuse and between the Meuse and the Argonne villages famous in the campaign for Verdun of 1916. The immediate effect of this advance was to break the German domination of the Paris-Chalons-Verdun railway, which had been cut by indirect fire for more than four years. Gouraud, on his side of the Argonne, pushed north and took all the ground famous in the Battle of Champagne of September, 1915, which had begun one day earlier.

This advance was then halted, as was inevitable, because it was an immediate threat to all the German lines of communication between Alsace-Lorraine and the Rheims-Laon front and particularly to the Metz-Mezieres-Valenciennes railroad. Ludendorff had to send reserves to the endangered front at once, and these reserves, on their arrival, succeeded not in stopping either the French or the Americans, but in slowing down their advance. The purpose of the operation had, however, been already achieved by the strain made upon German reserves.

Meantime the Belgians and British had been even more successful. Emerging form Ypres and the old Yser front they had taken Dixmude, the Forest of Houlhoust, and all the ground won in the offensive last year and lost this spring. They had crossed the Passchendaele ridge and broken out upon the Flanders plain, swiftly advancing toward Roulers on the north and toward Menin on the south-east. A wedge was thus driven between the German armies on the coast and about Lille. Lille itself was threatened with envelopment and, as the event proved, the German hold upon the Belgian coast was broken.

Once more a new strain was put upon German manpower. Although he must have recognized that he could not permanently hold the Belgian districts between the Scheldt and the sea, Ludendorff was obliged to gain time in which to remove the enormous accumulation of supplies and guns in the doomed region. Accordingly he sent more reserve divisions to Flanders and for the moment the Anglo-French drive slowed down. It did not stop, neither here nor between the Meuse and the Argonne was pressure relaxed, but for the moment Allied purpose was achieved and no useless sacrifice of men was made in too eager exploitation of undeniable success.

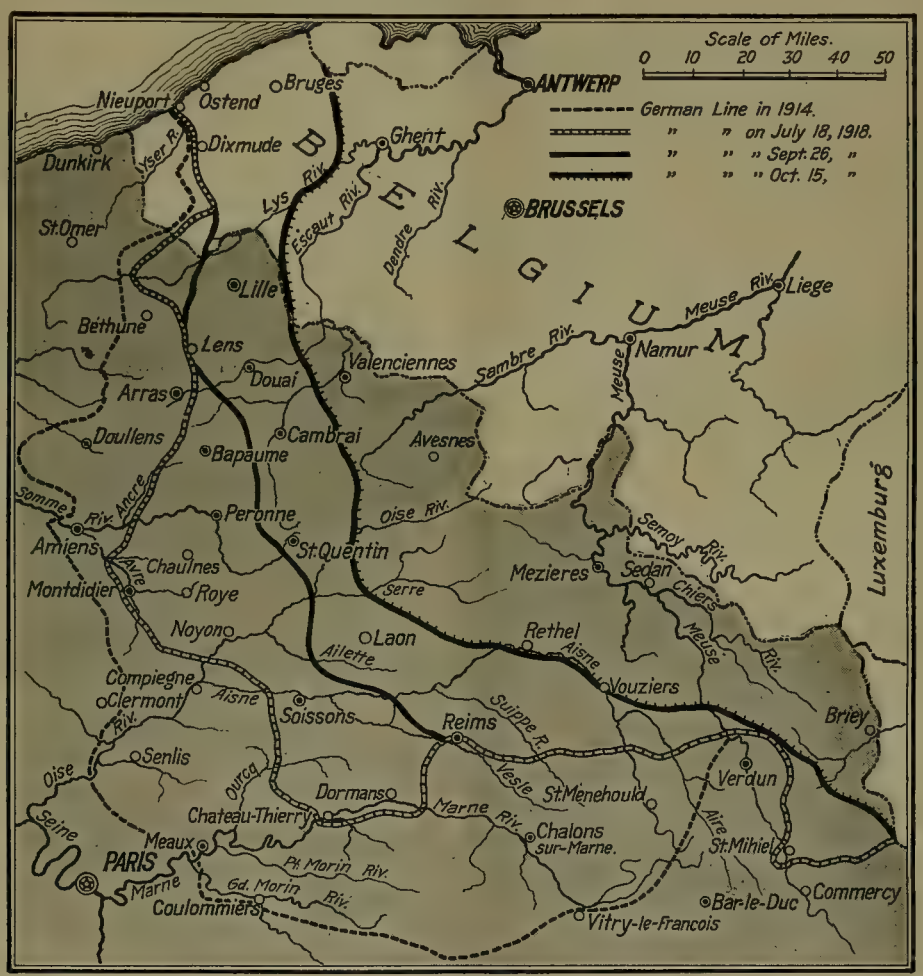
Having made Ludendorff anxious for both his flanks, Foch was now ready for his master-stroke. Already the British between the Scarpe and the Somme, between Douai and St. Quentin, had been active, had pushed forward and taken many valuable 'jumping-off' places. But on October 8, on the front between Cambrai and St. Quentin, aided by Debeney's French army between St. Quentin and the Oise, three British armies, those of Horne, Byng, and Rawlinson, struck. What happened was the greatest British achievement in all the centuries of British warfare on the continent. All the past disappointments were banished, all the old defeats were avenged; in three days the British drove straight through the 12 miles of the Hindenburg line, on the front where it was strongest, and pushed out into the open country beyond. By October 12 they were in Le Cateau. St. Quentin had fallen, the fall of Cambrai was assured, the old battlefield of First Cambrai, where Smith-Dorren's half of Sir John French's expeditionary army was almost destroyed, had been crossed by the victorious British. The Hindenburg line was a memory. This fact, too, should be emphasized, the British thrust was the final thrust of the whole battle. In the decisive battle of the World War Foch had called upon Haig's armies, as Napoleon was accustomed to call upon his Old Guard, and the British had made the response of the Old Guard. For the British this battle was the Third Battle of Cambrai, a detail in the vast battle of Foch, but it was, for the world, the decisive stroke in the winning of the War.

The consequences of the British success were immediately enormous. Their own advance was checked a few miles south of Valenciennes on the line of the Selle river, just north of Le Cateau, but their halt was exactly like that of the operative forces on the flanks. They had accomplished their purpose, they had broken the Hindenburg line, they had driven a wedge deeply into the German front and the Germans both in Lille and in all the new salient to the south between the Oise and the Aisne, including Laon and the St. Gobain forest and facing Rheims, were in a dangerous posture. The centre had performed its mission, it was time for the flanks to come to life again.

Once more the Americans and Gouraud, aided by Berthelot's army facing Rheims, struck northward. What followed was a swift German retirement between the Argonne and Rheims, the surrender of all the positions held since the retreat from the First Marne in September 1914, including the old forts above Rheims, from which the cathedral had been ruined and the city destroyed. Less precipitately, but no less inevitably, the Germans began a retirement between the Oise and the Aisne which cleared Laon and the St. Gobain forest

and surrendered that great central stronghold on which all their line in Northern France had been based. Meantime the Americans, far out beyond the Argonne, were slowly blasting their way forward and had reached Grandpre Gap, having cleared the Argonne. Thus the pressure upon the flank, instead of diminishing, grew and the Second American Army arrived in the battle line to add to the pressure.

But Foch was now done for the moment both with the German centre and left. Turning to the right, about Lille, to which front he had hurried Degoutte's French



MAP OF NORTHERN FRANCE AND BELGIUM

army, last heard of south of the Marne in July, he again pushed his wing forward, broke through all the German lines of defence and swept onward to the Lys in the south-east, to Roulers and Thiel in the north, and to Bruges and Ostend in the north-west. A swift collapse of German resistance followed. By October 16 the Germans were gone from the coast, Lille, Roubaix, and Tourcoing were evacuated, the Germans were stirring behind the Scheldt from Ghent southward. On the other side of the Lille salient, Douai had fallen and by the end of the week Horne's troops were approaching Valenciennes from north of the Sensee canal, while Byng's army was thrusting toward it from the south.

Thus, in three weeks Foch had upset the equilibrium of the whole German front from the sea to the Meuse. He had compelled the retreat from the Hindenburg line, with all its various annexes, he had ensured a retirement out of all French territory west of the Meuse, he had liberated Belgium west of the Scheldt, he had defeated the German army in a battle which they had accepted, on their own ground, prepared by them over four years. The ultimate consequences of his success were still problematical, no man could say exactly at what point the Germans would undertake to make a stand, but it was already certain that they would be unable to stand within French territory, the liberation of France had been accomplished, the advancing Allied armies were welcomed by thousands of French men and women, who had endured four years of slavery; for them the long night was over.

Such in its roughest form was Foch's supreme victory. It was not won over a demoralized enemy. On the contrary, the Germans fought with great persistence and

bravery. It was not the consequence of a collapse of their high command, for even after the defeat was assured the German armies were drawn back with great skill and unmistakable military efficiency. It was not in the first three weeks a rout, as Leipsic had not been a rout, but it was one of the most clearly cut victories in all military history, and for the Germans it was a defeat which terminated all hope, not merely of winning the War, but of imposing a deadlock. After the battle of the Hindenburg Line the certainty of a military decision was unmistakable.

If one wanted a parallel for Foch's tactics, one might perhaps cite the method of Lee at Gettysburg. In this battle the great Southern General attacked first by the left flank, then by the right, and finally threw Pickett upon the Union centre. Both of his flank operations were measurably successful, although neither led to any decisive advantage, but in the case of the centre Pickett was utterly unsuccessful and suffered a bloody repulse which left Lee's army incapable of renewing the offensive. Foch, on the contrary, was able to co-ordinate his three strokes in such fashion that when he struck the centre, the blows already delivered on the flanks had made a heavy draft upon Ludendorff's reserves, and not impossibly led to a weakening on the decisive front.

But, of course, all parallels are deceptive, and we are now dealing with a struggle on 200 miles of front, where Gettysburg covered less than ten.

The merit of Foch's strategy has lain in his ability to expand the pressure over a very wide front and multiply his partial thrusts so that the enemy was never able to get his breath and never able to anticipate in which direction the next blow was to fall. In a word, you have the difference between a brute and a man trained in self-defence. The brute undertook to destroy his antagonist by a few terrible blows. Foch parried or dodged these, and then began to play his antagonist, putting him on the defensive at the Second Marne, worrying him at the Third Somme, and making his ultimate defeat beyond question at the battle of the Hindenburg Line. Never was the superiority of French to German military science more perfectly revealed. French, like German, strategy is based upon Napoleonic principles, but while the German only imitated Napoleon, the Allied commander-in-chief interpreted him.

In a sense, all that is to come hereafter must be an anti-climax. The battle which we have witnessed at the Hindenburg Line is unquestionably the greatest battle of the present war as it is the most tremendous conflict of all human history. And in it has been revealed one of the supreme soldiers of all time. Henceforth and because of the achievement which has just unrolled before our own eyes, Foch will be recognized as one of the half-dozen great commanders of armies, the master of the present armies in human history, and the successful wielder of the most intricate and colossal military machine of which we have any knowledge. His three months from the Marne to the Scheldt, his campaign in Northern France in July, August, September, and October of the current year, with his three great successes, Second Marne, Third Somme, and the Battle of the Hindenburg Line, must be memorable for all later generations of soldiers who study the methods of war.

Such, then, was the Battle of the Hindenburg Line, as I see it, the Leipsic of the German imitators of Napoleonic ambitions as well as of Napoleonic strategy. But even this grandiose campaign was but one phase of the Foch strategy. He set out to drive the Germans out of France, to rout them if he could, to win the decisive battle in any event, and to this extent he held to the familiar theory of the 'Westerners', that only in the West could the War be won or lost. But in doing this he did not forget the East.

In this respect his calculations were clear. German victory in the War depended upon two things, the defeat of the enemy in the west and the preservation of that empire in the east, which was known to all the world as Mitteleuropa. If the eastern empire collapsed, then only a decisive victory, a new western Sedan of the enemy, would bring victory to Germany. But if the east were held, Germany could put up with nothing better than a deadlock in the west, a long drawn out and much magnified repetition of the Somme of 1916. She could calculate that unless the Allies could win a decisive victory in the west they would bargain with her for peace in the coming winter, and in that bargaining she could trade western holdings for eastern conquests.

Accordingly, before he launched his great western battle, Foch threw Allenby against Turkey in Palestine and D'Esperey against Bulgaria in Macedonia. The result of these two thrusts were immediate and final.

But the victory over the Bulgarians was even more costly to the German. Even before the battle of the Hindenburg line has reached its decisive phase, Berlin knew, not merely that Turkey had been crushed, but also that the Bulgarian army had been routed and that Bulgaria had surrendered unconditionally.

The Foch strategy has to be seen whole to be appreciated in its full splendor. He co-ordinated the operations in Palestine and Macedonia with those in Flanders and Champagne, the result being the most wonderful climax of any military campaign. Damascus, Beirut, Uskub, Nish, Lille, Douai, Cambrai, and St. Quentin fell, if not at the same moment, at least in rapid succession; the world, German as well as Allied or neutral, had the sudden impression of the visible collapse, the simultaneous collapse of all the various elements in the German world empire. In the second week of September that empire reached the Jordan and the Euphrates on the south and touched the North Sea on the Belgian coast. By the end of the second week in October it stopped at the Danube and was rapidly receding from the Belgian coast. Its Austrian faction was crumbling into ruins and its Bulgarian and Turkish departments were in dust and ashes. Belgium and Serbia were emerging from the German waves. France was rapidly clearing of German occupation—for the German the whole world had suddenly turned upside down—for the rest of us it was assuming its normal position.

The battle of the Hindenburg line won the War.

A Rapid Method for Determining Titanium and Chromium in Beach-Sand

By E. P. BARRETT

*Tests have been made at the Pacific Northwest Experiment Station of the U. S. Bureau of Mines, at Seattle, on the magnetic concentration of various beach-sands carrying chromite and magnetite, with titanium. Different methods of analysis were tried with varying degrees of success. This work resulted in adopting a method that depends upon the fact that a fusion of the sand with sodium peroxide leaves the iron as insoluble ferric hydroxide, and the titanium as sodium titanate insoluble in an excess of sodium hydroxide, while the chromium is in the form of sodium chromate, which is readily soluble in the excess of sodium hydroxide. A perfect fusion is assured in all cases, and rarely requires heating for more than five minutes over a Meeker burner. The details of the method are given herewith.

Five-tenths to one gramme of the ore, through 150-mesh, is weighed into a porcelain crucible containing about 6 or 8 gm. sodium peroxide. The ore is mixed with the peroxide and fused over a Meeker burner. Hold the crucible in tongs, so as to rotate the contents after fusion begins. Heat slowly at first. In case a perfect fusion is not obtained by the end of five minutes, cool, add a little more peroxide, and heat again.

Insert the crucible in a 600-cc. beaker about two-thirds full of water, place on a hot plate and boil for at least 15 minutes. Cool in a tray of running water (10 minutes will suffice). Filter and wash with dilute sodium hydroxide. All the iron and titanium is in the residue and the chromium is in the filtrate. Save this for the chromium determination.

Wash the residue through the filter with hot 10% sulphuric acid. Wash well with hot water, and add 10 cc. hydrochloric acid. The filtrate should now be about 100 cc. Proceed now in accordance with the following method, which is essentially that described by P. W. and E. B. Shimer, Proceedings of Eighth International Congress of Applied Chemistry, but modified somewhat by Scott†, differing principally in the form of reductor and also in a few details of operation from the Shimer method.

Dissolve about 30 gm. of ferric ammonium sulphate in 300 cc. water, acidified with 10 cc. sulphuric acid; add potassium permanganate drop by drop as long as the pink color disappears, to oxidize any ferrous to ferric iron, and dilute to one litre. Standardize this solution in terms of iron. The iron value times 1.4329 gives the value per cubic centimetre in terms of TiO_2, and the iron value times 0.86046 gives the value per cubic centimetre in terms of metallic titanium. Use a saturated solution of potassium thiocyanate as the indicator.

As a reductor a 500-cc. dispensing burette is used. The internal dimensions of the burette are about 1⅝ by 22 inches. The reductor is charged with 1200 gm. of 20-mesh amalgamated zinc, making a column about 12 in. high and having an interstitial volume of 135 cc. This form of reductor is convenient, and when used as hereafter described is adapted to maintaining hot solutions, essential for complete reduction of the titanium. The reductor is connected to a litre-flask for receiving the reduced titanium solution through a three-hole rubber stopper, which carries also an inlet-tube for carbon-dioxide supply, and an outlet tube for connecting with the suction-pump.

The reductor is prepared for use by first passing through it a little hot dilute sulphuric acid followed by hot water, finally leaving sufficient hot water in the reductor to fill to the upper level of the zinc.

The hot titanic solution, prepared as described above, is now introduced, about 100 cc. of the water being drawn from the reductor into the original beaker to bring the solution to about the upper level of the zinc. The water thus removed will not contain any titanium if the operation has been conducted as described, but it serves as a safeguard and is also convenient to acidify this water with 10 cc. sulphuric acid and reserve on the hot plate to be used as an acid wash after the reduction of the sample solution.

The titanium solution is allowed to remain in the reductor for 10 minutes. While the solution is being reduced, the receiving-flask is connected with the suction-pump, the air in the receiving-flask is displaced by carbon dioxide, and, while continuing the flow of carbon dioxide, the reduced solution is drawn out, followed by the reserved acid wash and then three or four 100-cc. washes of hot water. The displacement of the sample solution and the washing of the zinc is so regulated by means of the stopcock that the reductor is always filled with solution or water to the upper level of the zinc. When the washing is complete, release the suction gradually to prevent air being drawn into the receiving-flask.

Disconnect the flask, add 5 cc. indicator, and titrate immediately with ferric ammonium-sulphate solution

*By courtesy of the Director of the U. S. Bureau of Mines. The author is assistant-chemist to the Bureau.

†Scott, Wilfred W., 'Standard Methods of Chemical Analysis'.

until a brown color is produced, which will remain for at least one minute.

The filtrate containing the chromium is acidified with about 20 to 30 cc. sulphuric acid. Pour the solution into a 1½-litre beaker containing about 600 cc. water. Run in excess ferrous ammonium-sulphate solution, about 90 gm. per litre, using potassium ferri-cyanide as an indicator. At once titrate excess ferrous ammonium sulphate with potassium permanganate to a faint pink and point.

To standardize the ferrous ammonium-sulphate solution, weigh out portions of pure potassium dichromate of about 0.25 gm. This weight times 0.518 gives the value in Cr_2O_3. Dissolve in water. Dilute to about 1200 cc., add 20 cc. sulphuric acid, and run in excess ferrous ammonium sulphate, titrating excess with permanganate. Determine the value of 1 cc. permanganate solution in terms of ferrous ammonium-sulphate solution so as to be able to calculate the number of cubic centimetres of ferrous ammonium sulphate actually required to titrate the Cr_2O_3. Run 15 or 20 cc. ferrous ammonium-sulphate solution into about 1200 cc. water containing about 20 cc. sulphuric acid and titrate to a faint pink with permanganate. The permanganate solution used for iron determinations is employed in this method; it need not be standardized. It is advisable to standardize the ferrous ammonium sulphate every time it is used.

This method is also used to make assays for Cr_2O_3 in chromite. An assay can be made in about one hour. When assaying for Cr_2O_3 only, it is advisable to use an iron crucible for the fusion.

Colloids and Flotation

The U. S. Bureau of Mines has issued a technical paper, No. 200, to show the application of certain facts of colloidal chemistry and physics to flotation practice. Some of the unexplainable troubles in the flotation plant can probably be explained by the study of colloids. It draws attention to the fact that at times some sulphides are not wetted by water and under other conditions are wetted. The last case is, of course, an abnormal one and when this condition obtains flotation is impossible. It can probably be explained by adsorption.

The adsorption phenomena are an effect due to surface-energy. Surface-energy is a product of surface-tension multiplied by area. Therefore, the adsorption phenomena are affected by any factor that tends to increase or reduce surface-tension. The surface-energy and adsorption effects for solids can only be proved by analogy of the action of liquids and gases.

Willard Gibbs developed a thermo-dynamic formula to show that adsorption is due to a concentration of molecules in the surface of solids or liquids and that it can be either positive or negative; therefore, any material that will give negative adsorption for water would, of course, probably give positive adsorption for gases. Impurities in solution tend to upset surface-energy conditions and would cause positive adsorption for gases to be changed to negative adsorption for them. As adsorption is manifest by wetting or non-wetting in our case, it is seen that under certain conditions some sulphides can be wetted by water while others cannot.

In dealing with a solid, water, and oil phase the action of adsorption toward the solid will be the algebraic sum of the surface-energies of all the material entering into the sphere of action. Hence any substance that tends to upset the surface-tension or energy of any one of the three or four phases involved would tend to change the resultant surface-energies of all of them and hence upset the conditions that have been established for adsorption of either the water or the gases involved. It follows that any impurities in solution in the water would tend to affect this algebraic sum and hence upset the equilibrium necessary to float the sulphides from the pulp; also, as the surface-energy is the product of the surface-energy multiplied by the area, the presence of any material having largely developed surfaces, principally colloids, would tend to upset the equilibrium and the flotation.

As size is such an important factor it is plain that the oil can be too much emulsified. In fact, when the oil is in an extremely colloidal condition it is impossible to get good flotation results. The fact that the materials which tend to throw the oils out of emulsion are substances that benefit flotation is a proof of this statement.

A practical illustration of some of these deductions is obtained in the Inspiration mill, where it was found to be impossible to float the copper sulphide from the gangue containing large amounts of decomposed material, such as koalin, which is a colloid. No trouble was encountered in floating the hard undecomposed ore.

There are several different types of colloids, but the most important are the so-called irreversible and reversible colloids. The irreversible colloids are those most liable to be present in ore-pulps, being iron, aluminum hydroxide, etc. They are called 'irreversible' because it is impossible to put them back in colloidal condition after having once flocculated them by means of an electrolyte. The 'reversible' colloids are those that can be put back into colloidal condition by simply shaking after flocculation. They are inactive toward electrolytes. Among such colloids might be mentioned aqueous solutions of gellatine, glue, gum, tungstic acid, and molybdic acid. These cause great trouble in flotation and are difficult to remove.

Protective colloids should also be mentioned. They are simply colloids that prevent the precipitation of the irreversible colloids, making impossible their removal by means of electrolytes. Common ones are soapine, tannine, glue, and humic acid. It is recognized as impossible to float in the presence of this type of material.

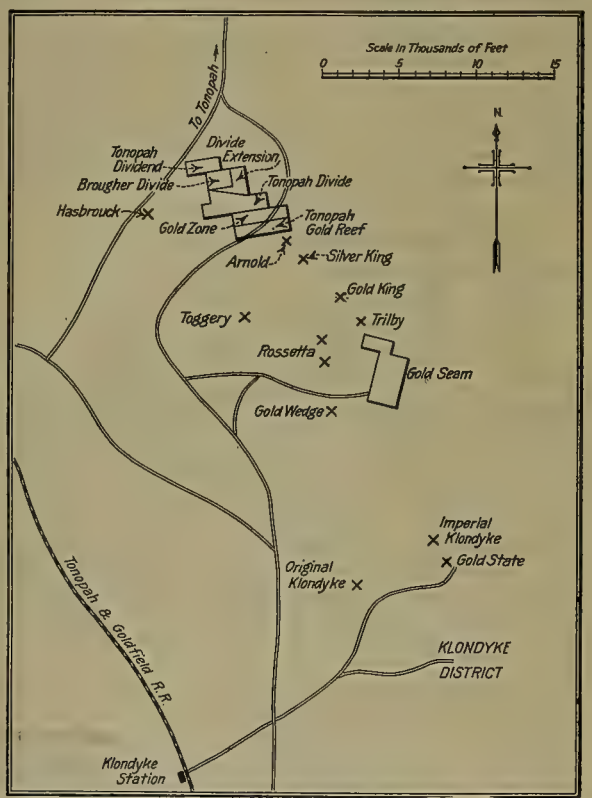
From the above short discussion several conclusions may be drawn. Evidently colloids interfere greatly with flotation and in order to overcome the difficulty they must be removed. There are several ways of doing this, among them being preliminary heating of the ore, washing the ore, or flocculation by means of electrolytes. These are the means of removing irreversible colloids. So far as is known, there is no way at present of overcoming the difficulty due to productive or reversible colloids.

TONOPAH, NEVADA

The Divide District, Particularly the Tonopah Divide Mine.

On the 260-ft. level of the Tonopah Divide mine, in the Divide district, six miles south of Tonopah, a cross-cut to the south has penetrated the 'gold vein' that outcrops near the summit of the divide and has a strike parallel to that of the main ore-channel. The cross-cut has exposed seams of ore assaying $75 per ton. This vein yielded high-grade gold ore from shallow workings, and it was for the purpose of prospecting this vein at depth that the main shaft was sunk. A cross-cut south on the 160-ft. level exposed the big vein that has now been thoroughly developed on the 160, 265, and 370-ft. levels. The orebody has been opened for 300 ft., showing an average width on all levels of over 25 ft. Engineers have estimated the ore blocked out at over $3,000,000. The gold vein has been cut at a distance of 570 ft. from the shaft and over 400 ft. below its apex, which is high above the collar of the main shaft. George Wingfield, one of the principal owners of the mine, says that the cross-cut will be continued to cut another vein to the south, and drifts will be started at once both ways on the gold vein. An auxiliary hoist has been put in at the station on the 370-ft. level of the main shaft for the purpose of sinking to water-level, estimated to be not less than 700 ft. Drifts are being advanced in the vein on the three main levels, and on the two lower levels raises and cross-cuts are being driven at 50-ft. intervals to block out the ore. All working faces are said to be in good ore. Cross-cuts from the shaft entered the vein near a vertical fault. North-west of the fault the ore is of better grade than south-east; the hanging-wall drift on the 370-ft. level to the north-east broke ore for a distance of 120 ft., averaging above $50; while the average of 26 ft. across the vein in the north-east cross-cut was $62 per ton. South-east of the fault the ore, of equal width, varied from $15 to $30 per ton. Molybdenite appeared in considerable quantity on the 160-ft. level, but at 265 ft. it has been found only in a few small seams; it is rarely found on the 370-ft. level. The ore-dump near the shaft contains over 6000 tons that is reported to assay nearly $30 per ton in silver and gold, all extracted during development. This ore is being shipped at the rate of 220 tons weekly to the Goldfield Consolidated mill, where it is treated by cyanidation. The ore is hauled seven miles to Klondyke station on the Tonopah & Goldfield railroad, where it is loaded in ore-bins from a platform, thence 15 miles to the mill. Flotation tests on this ore indicated a satisfactory extraction, but cyanidation was adopted because of existing obstacles to the marketing of flotation concentrate. The mine has been equipped with an excellent surface plant, driven by electric power and with capacity for a large amount of development. Production will not be increased much for the present, as it is designed, in view of the labor shortage and high cost of mine supplies, merely to meet operating costs and provide a surplus that in another year will afford means for mill or railroad construction, as the need shall then be determined.

Several other properties in the district are being developed, notably the Brougher Divide, Gold Zone, East Divide, and Hasbrouck. Others, including the Divide Extension, Tonopah Dividend, Gold Reef, and Sutherland Divide, are to be worked as soon as funds are available. The East Divide is sinking near the hanging wall of what is believed to be the Divide vein, at a point where the quartz outcrop assayed $5 per ton in gold. Nearly all of these properties have been equipped with good electrically-driven surface plants. Locations have been filed covering a large area



PROPERTY MAP OF DIVIDE DISTRICT, NEVADA

surrounding the Divide mine, and some good ore has been found in surface work at a half dozen points a mile or more from the central properties.

Shortage of labor at Tonopah has been less pronounced than in some other Nevada districts, on account of the large number of foreign-born men who have been placed in deferred classifications in the draft, or who have been granted exemption as enemy aliens. Many of the miners are Austrians or Slavs of Austrian nationality.

LEAD, SOUTH DAKOTA

General Notes From the Black Hills.

Lead.—Owing to shortage of labor the Mineral Point mill of the Homestake company has been stopped. This will decrease the daily output by 500 tons. The total number of stamps dropping heretofore was 1020, but with this plant out of commission leaves 920.

One car of tungsten ore has been shipped from the Bismarck and Wasp mines to Colorado. The cyanide plant that has been treating ore from the Bismarck has been closed after being in commission for the greater part of the year.

Deadwood.—Good progress is being made in the driving of the tunnel at the Titanic property in the Carbonate district. The compressor at the Iron Hill mine is at work. The air is piped a distance of 1500 ft. to the portal of the tunnel, where it will be used by machine-drills. Driving of the tunnel has been let on contract, and will prospect considerable virgin ground in a once famous silver district.

Custer.—The Rare Minerals Co. is a new corporation that has been formed by local people to mine and treat minerals in the Custer district. A small concentrator is under construction and will be used for dressing tin, tungsten, and rare minerals. The plant should be in commission before the first of the new year.

Roubaix.—The Custer Peak company has erected a steam hoist and compressor at the Jungle mine, which was recently purchased, and sinking of the shaft has been commenced. At present the shaft has a depth of 125 ft., and this will be continued to 400 ft. The 'ore vertical' has a width of 10 ft., and gives returns of 8% copper. A small concentrator has been erected, and will be operated along with the sinking of the shaft.

VICTORIA, BRITISH COLUMBIA

Chrome Deposits.—Gold in Cariboo District.—Roads in Mining Districts.—Skeena Copper Deposits.—Manganese on Vancouver Island.—Gold from America.

Under the terms of a recent Order-in-Council, the Canadian War Trade Board is authorized to take possession and to operate for a period of five years if necessary any mines or properties in Canada that are producing chrome ore or which have produced it in the past. War conditions have led to the taking of this step, it being explained that lack of shipping has created a serious shortage of chrome in America and for other Allied nations. It is known that undeveloped chrome exists in different parts of the Dominion, some in British Columbia. In the event of the War Trade Board and the owners of such mining properties being unable to come to terms as to the amount of compensation to be paid, provision is made for reference of the question to the Exchequer Court for adjustment.

Gold-producing possibilities of the Cariboo district, which has an output aggregating $65,000,000, is the subject of an interesting report by B. B. McKay, of the Provincial Branch of the Dominion Geological Survey. He spent a good part of the summer in that district. Notwithstanding the heavy increase in the cost of mining operations, production is going on steadily. He predicts that in many parts of the country there will be much gold recovered, but does not look for this development until after the War, when labor becomes more available. The use of hydraulicking, dredging, drag-line scraping, etc., will make conditions better. Lack of transportation facilities is holding back development, there being areas in the vicinity of Keithley and Harvey creeks that want even the roughest of wagon-roads.

One of the most important public works undertaken by the Mines Department of British Columbia, with a view to opening a promising mineral district, is the construction of what is known locally as the Big Bend road, which runs from the Revelstoke north along the Columbia river. The country is rough and mountainous and the work is expensive. The road now is open to La Forme creek, where are situated a number of promising mining prospects.

Erection of the new plant in preparation for winter operations is occupying the attention of the Delta Copper Co. This property is situated on Rocher de Boule mountain, Skeena district. Latest reports are to the effect that on the east end of the claims, at an elevation of 6250 ft., an orebody is blocked out on the upper vein. On the west there is 6 ft. of ore, and lying between these workings is 22 in. of chalcopyrite that assays 16.5% copper.

In reporting on the recent discoveries of manganese ore on Vancouver Island, W. M. Brewer, resident engineer, states that the deposits in question are, in his opinion, of considerable importance. As there has been little development done their extent is undetermined. Samples assayed by the Provincial Bureau of Mines show between 15.88 and 52.60% Mn, the majority of the samples yielding over 40%. G. C. Mackenzie, Western representative of the Munition Resource Commission, considers 2000 tons is immediately available. It is stated that the deposits occur in a belt of cherty jasperized rock, which is said to be continuous from Mt. Sicker to the northerly end of Cowichan lake, a distance of 40 miles, and is included in the Mt. Sicker series of rock formation. Sufficient work has not been done to determine whether the deposits are residual or are replacement deposits in the jasperized rock, and occupy fissures in the sheared portion of the belt of rocks. The latter theory would appear, from the conditions at present shown by the shallow work that has been done, to be the most tenable; and if such prove to be the case it is reasonable to presume that the ore deposits may possibly persist to considerable depth, as the shearing movement appears to be widespread and deep-seated.

It is stated in Vancouver that, despite the efforts of the United States authorities at the border, American gold continues to come into Canada for barter and exchange, especially among the Chinese, who pay as high as 35% premium for coinage. This in turn, it is claimed, is shipped out of Canada to the Orient. During recent months the price for gold among the currency gamblers in the Oriental quarter of Van couver has increased from 10 to 30%.

TORONTO, ONTARIO

Porcupine, Boston Creek, and Matachewan.

Porcupine.—The Dome Mines company is preparing for a greatly increased output as soon as milling is resumed. Ore already broken underground amounts to over eight months supply for the mill, which has a capacity of 40,000 tons monthly. Waste-pockets and ore-loading stations have been cut on the 960 and 1200-ft. levels. Lateral work is under way at 1000, 1150, and 1200 feet.

Boston Creek.—Four veins have been found in the Knox claims near the Miller-Independence. The largest, 4 ft. wide, which promises well, has been uncovered for 400 feet.

At the Miller-Independence some exceptionally rich ore has been opened. In addition to a pay-streak 4 to 5 ft. wide, in which telluride of gold occurs in large quantities, the vein has 6 to 8 ft. of high-grade milling ore.

Development at the O'Donald has uncovered a rich vein, traced for 400 ft. to the Patricia boundary. It is thought to be a continuation of the main vein of that property.

A vein recently opened on the Cotter carries visible gold and tellurides. An extension of this vein is found on the Cullen-Renaud claims.

Matachewan.—It is officially stated that the extensive diamond-drilling done on the Otisse has been satisfactory, indicating a large quantity of milling ore. Work has been suspended owing to the difficulty and excessive cost of transportation, but as soon as the winter roads are suitable a first-class mining plant will be taken in. The Colorado Ontario Development Co. which now owns the property, will be taken over by a new company known as the Matachewan Gold Mines, Ltd., capitalized at $4,000,000. Prominently identified with it are Charles Flynn, C. A. Foster, and Walter J. Boland, members of the old company.

ARIZONA

Dos Cabezos.—The Mascot Copper Co. has issued its report for the year ended August 31, 1918. The financial situation is unsatisfactory, while no figures of ore-reserves are given. In April 1917 the A. S. & R. Co. took a 20-year lease on the property, but cancelled it in February 1918. This found the company with a developed and equipped mine but no funds. The president, T. N. McCauley, personally advanced $42,000, and on August 31 he was owed $63,078. Current assets total $64,911, plus $9279 cash. Current liabilities amount to $74,164 for loans and interest, plus $44,269 for sundry credits. The company owns a 15-mile railway, running between the terminal of its 2-mile aerial tram and the Southern Pacific line at Willcox. There was $217,588 spent on this road. The report states that over $3,000,000 has been spent in development and equipment. The plant includes two 250-hp. Union gas engines, two Ingersoll-Rand compressors, dynamo, machine-shop, machine-drills, diamond-drills, assay-office, aerial tram, automobiles, and 90 buildings. Fifteen holes are said to have found 23 new orebodies. On August 20, 1918, the directors asked shareholders to contribute 1c. per share. The 1,000,000 $10 shares issued are non-assessable. During the year under review there was 1218 ft. of development done. This brings the total to 27,427 ft., plus 28,101 ft. of drilling. The general superintendent, J. W. Prout, Jr., considers that the geologic conditions are intricate. He has planned for 2500 ft. of work above the 450-ft. level. During the year, 13,276 tons of 3% copper and 0.5 oz. silver ore was sent to the smelter. The gross value was $147,896. There does not appear to have been any profit from this, as the balance-sheet shows none. From September 1915 to October 1918 there was smelted 32,182 tons of 3.17% ore, also 0.5 oz. silver per ton. Its gross value was $425,172, less freight and smelter charges. The local treatment of the ore is considered advisable. The ore carries 25% silica and alumina, also 40% iron. Experiments suggest magnetic separation and wet concentration, the concentrate to be roasted and leached, recovery of the copper to be by electrolytic methods.

Dragoon.—It is reported that a 5-ft. vein of gold ore, assaying $130 per ton, has been opened in a property paralleling the Gold Ridge mine in the Dos Cabezos district. The ore is being hauled by mule-team to the Golden Rule mill, four miles from Dragoon.

Duncon.—The Duncon Mining & Milling Co. has commenced operations at Mount Royal, and proposes to erect an 80-ton concentrator.

Quartzsite.—A gold discovery of considerable importance is reported from the Pluamos mountains, 15 miles from Quartzsite, near New Water springs.

Tucson.—J. A. Chapman of Columbia, Tennessee, and C. F. Hagedorn of Chicago, have brought suit in the Superior Court to obtain the return of $20,000 lent by them to the Daily Arizona Consolidated Copper Co. to purchase additional claims. It is alleged that the loan was secured by misrepresentation.

Wickenburg.—The Octave Mining Co. has commenced construction of a 250-ton stamp-mill. Mining has been carried on during the past three years, and sufficient ore is available to warrant the mill.

Ray.—The third quarterly report of Ray Consolidated shows the following, compared with the previous period:

	Third quarter	Second quarter
Profit	$ 883,348	$2,255,217
Dividends	1,182,884	1,182,884
Surplus or deficit	−$299,534	+$1,072,333
Development, feet	10,418	14,420
Cost of mining, per ton	$1.865	$1.621
Ore milled, tons	845,400	881,800
Copper content, per cent	1.602	1.643
Recovery, per cent	75.18	75.81
Cost of milling, per ton	1.133	0.978
Copper output, pounds	20,358,589	21,963,414
Cost per pound, cents	20.283	16.468

Wages, smelting and refining rates, supplies, and a decrease in efficiency were the causes of the higher costs.

CALIFORNIA

Idria.—Fire that did considerable damage in No. 2 workings of the New Idria company is under control.

Mineral King.—It is reported at Visalia that there is a revival of interest in this old district, which is 55 miles east. Lack of transportation facilities is against exploration.

Red Bluff.—Like many others, the Tedoc chrome mine has suffered from the chrome market. The superintendent, J. H. Hart, states that the company spent $34,000 in constructing 12 miles of road this season. Operations came out about even. Ore was sold as high as $76 per ton, but now it only realizes $36. About 3000 tons was extracted this season, and 200 tons is in bins awaiting transportation.

Redding.—The chrome mines on Beegum creek, 55 miles south-west, over the line in Tehama county, have been shut-down for the winter, condition of roads making it impossible to haul ore to rail.

San Jose.—Manganese ore worth $10,923 has been sold by this city from the so-called meteor in Alum Rock park. The cost of mining was $500. Owing to lack of demand, extraction has been suspended.

Trinity Center.—The main shafting for the Estabrook dredge, a steel casting weighing 23,000 lb. (16 ft. long and 24 in. diameter), has been taken from Redding to the site. A caterpillar engine of 75 hp. was used in hauling the logging-truck on which the heavy piece was loaded.

COLORADO

Boulder.—Shareholders in the Boulder Tungsten Production Co. are said to be dissatisfied with the condition of the company. When the price of tungsten dropped in 1916 the company was completing its ferro-tungsten refinery and had established a market for its output. The finances were crippled to a serious extent, rendering it necessary to curtail development and retrench to the utmost. This was done, and the only activity of the company was confined to work in the mines on orebodies that were opened and in sections where lease operators had good prospects of new discoveries. Under this policy the mines were being gradually brought to an increasing production basis and revenues from lease output gave funds to support more pressing claims. Revival in the tungsten market and a steadily advancing price

gave promise in recent months that the company would soon be re-established to a position to conduct its business on the broader and more aggressive scale which so perfectly organized an investment demanded, according to the Boulder county 'Miner'. At this stage, however, impatient stockholders began to be importunate, and, headed by Mrs. Tindolph, daughter of the late J. N. Williams, one of the original incorporators and a member of the board of directors, began court proceedings to force matters to issue in an attempt to realize from their holdings. The management early tendered them control of the company and the full management, provided they would furnish funds for the relief of the company from its obligations and with which to enable it to proceed with the development of its mines and maintenance of its tungsten manufacturing enterprise. This they were not prepared to do, but persisted in agitating discontent among the stockholders. A meeting was called to be held at Chicago last week, at which definite steps to secure the appointment of a receiver were reported to be planned. Those acquainted with the company recognize that such action at this time will precipitate the troubles of the company and work directly into the hands of the powerful influences that have at all times been directed against this independent factor in the practically monopolized tungsten industry, and would undoubtedly result in the disintegration of the company and the loss of its mineral holdings. The manager, J. G. Clark, has the support of a great majority of the stockholders.

Cripple Creek.—The lessee of the Stratton Cripple Creek M. & D. Co.'s Keener tunnel dump, H. Von Phul, is shipping 70 tons of $5 to $6 ore every other day to the Portland company's Independence mill.

Rico.—Alunite is reported as being developed in this district.

MICHIGAN

Houghton.—Stocks of copper are low at every smelter in this district; in fact, no metal is being put in storage, and the close of navigation finds every dock cleaned up. Shipments by rail, many by express, and by preferred freight, continue to go East.

Copper Range Company pays $1.50 per share, equal to $585,504. This makes $6 for the current year.

Calumet & Hecla reports as follows for October, in pounds:

Mine	October	10 months
Ahmeek	1,951,655	21,316,285
Allouez	529,859	6,075,712
Calumet & Hecla	5,859,296	57,398,092
Centennial	249,200	2,101,562
Isle Royale	1,461,207	12,523,205
La Salle	119,857	1,570,962
Osceola	1,217,910	13,515,753
Superior	78,715	1,470,571
White Pine	462,230	2,517,054

Isle Royale is now producing from six shafts, and its tonnage will be increased to 5000 tons daily within a year, if the labor situation permits. The present output is 3700 tons. Twelve electric locomotives are at work and eight more will be added as soon as they can be secured. The Isle Royale mill at Houghton is dressing 2100 tons daily, including Sunday. Tonnage to the No. 1 Lake mill at Point Mills has been as high as 1800 tons and as low as 500 tons, but is averaging between 28 and 30 carloads. Three stamps at Point Mills are at the service of the Isle Royale company, and a fourth is being arranged. More men are coming to work at the Isle Royale every day. The Government work at Senter is not as attractive as it was when operations started. That work took a good many Isle Royale men.

MISSOURI

Joplin.—Production of the Tri-State region last week totaled 4470 tons of blende, 860 tons of calamine, and 1089 tons of lead. These averaged $52, $39, and $100 per ton, respectively. The total value was $408,001, making $22,846,709 to November 16. Missouri contributed $114,401 to last week's output.

The market was light and unsatisfactory, according to the 'News Herald'. There is estimated to be a surplus of 18,000 tons of blende in the region. A hundred producers met at the Connor hotel on the 16th, and the following resolution, prepared by a committee composed of Edgar Wallower, C. F. Dike, and Temple Chapman, was adopted by the operators:

"Whereas, the zinc-ore buyers in the Missouri, Kansas, and Oklahoma district are purchasing less than one-half of the present output of the district, and there is now sufficient surplus tonnage in storage to supply the limited demand for some time.

Resolved, That the mine operators of the Missouri, Kansas, and Oklahoma district, assembled at the Connor hotel, Saturday, November 16, 1918, agree to shut-down the mines of the district, provided that 60% of the tonnage of the district sign this agreement, this shut-down to remain effective until the surplus tonnage of ores in the district shall have been absorbed, and the operators in session agree to a resumption of production."

Waco.—At the Blue Rock lease, owned by the Crescent Lead & Zinc Co., 9 of 14 drill-holes have cut good ore, three assaying 20%. One shaft is down 101 ft. and another 142 ft. The ore extends from 185 to 255 ft. A 200-ton mill is being erected. It will be driven by oil-engines. Glenn Smith is in charge.

MONTANA

Butte.—Davis-Daly pays 25c. per share, equal to $150,000, on December 30.

The Anaconda company is reported to have suspended mining of manganese ore at the Emma. About 10,000 tons monthly was extracted, 8000 tons going East and the remainder to the ferro-manganese plant at Great Falls. The Butte-Detroit Copper & Zinc Co. is concentrating manganese ore. It will continue this work, as it has a large contract with the U. S. Steel Corporation.

Federal agents have been making an investigation into copper-production problems and labor conditions at Butte, according to the 'Miner'. Scott Leavitt, of Great Falls, special agent of the Department of Labor, who has been assigned to this district for that purpose, held a series of conferences on November 15 with mining operators and labor representatives.

Federal officials declare that the I. W. W. of Butte have failed in another attempt to curtail copper production. At a meeting of the I. W. W. local No. 800, held on November 18, unexpected opposition to a strike proposal developed. As a result, the organization was divided into two factions, one desiring and the other opposing a strike. The radical element, it is said, desires abolition of the rustling-card and $6 for an eight-hour day. Mining operators declare that I. W. W. propaganda has been circulated among the miners and numerous acts of sabotage have been committed. Scott Leavitt, State Director of Labor and special representative of the Federal Department of Labor, continued his investigations, and held conferences with the mining operators and labor representatives. He stated that he was at Butte under a special commission from the Secretary of Labor to act as his special representative in attempting to bring about the largest degree of co-operation and feeling of confidence on the part of the employees in the Butte copper industry, and by establishing and supervising a certain measure of the control over employment in such industry.

Kendall.—Barnes-King Development Co. paid dividend No. 7, of $40,000, on November 15. This makes $260,000

to date. The report for the third quarter of 1918 shows a profit of $55,704 for the period. The total revenue was $183,942. The balance from the second quarter was $213,817, and that carried forward $185,664, which is cash and bullion. Production was as under:

Mine	Tons	Value per ton	Profit
Kendall	3,680	....	$1,388
North Moccasin	5,580	$8.59	8,853
Piegan-Gloster	3,446	8.07	.....
Shannon	5,924	17.61	61,736

In the Shannon there is now an ore-shoot 300 ft. long in the 500' west drift. This has not been opened on other levels yet. Results in the Mt. Pleasant mine were fair. The October gold yield of the properties was $36,000.

NEVADA

Goldfield.—The Spearhead company reports that the ore-shoot on the 910-ft. level persists, and assays $95 per ton. Shares rose from 2 cents, the price two weeks ago, to 9 cents. Other Goldfield shares improved.

Silver Peak.—A lease for 20 months has been granted to D. Trepp and M. Chiaovich on the Treasure State claims at Indian Garden, 16 miles south of Silver Peak. The ore carries silver and lead.

Tonopah.—Production of the district lately has been as under:

Week ended	Tons	Value
October 26	9,265	$157,505
November 2	8,839	150,263
" 9	8,582	145,984
" 16	6,311	107,287

October yields of some of the mines were as follows:

Mine	Tons	Silver, oz.	Gold, oz.	Profit
Belmont	9,968	116,378	1,185	$64,858
Jim Butler	1,054	.....	....	5,943

The Extension is sinking from 1760 to 1810 ft. A turbine-pump is to be lowered from the 1680 to the 1760-ft. station.

The Tonopah Mining Co. has cleaned-up all of its low-grade dumps, the ore being treated at a profit. The metallurgical department is investigating whether the old sand dumps at Millers can be treated profitably. This product was leached by cyanide.

OKLAHOMA

Miami.—In Oklahoma the Robert W. Hunt Engineering Co. controls the Pittsburg-Miami, Zinc-Lead Corporation, and Producers company. At the first, water has delayed starting of the new mill. The workings are 270 ft. deep. The second is north of Tar River. Sixty drill-holes were put down in a 40-acre lease. A 300-ton mill shows the ore to carry 6% blende and lead. A shaft is being sunk at the Producers.

Picher.—Production of the fields last week amounted to 3100 tons of blende and 869 tons of lead, valued at $275,300.

UTAH

Bingham.—Utah Copper reports as under for the third quarter of 1918, compared with the second period:

	Third quarter	Second quarter
Profit from operations	$4,169,698	$5,483,813
Dividends received, etc.	1,140,314	1,009,564
Total profit	$5,310,002	$6,493,377
Dividends paid	4,061,225	4,061,225
Surplus	$1,248,787	$2,432,152
Capping removed, cubic yards	1,082,280	1,167,515
Ore milled, tons	3,412,700	3,201,900
Copper content, per cent	1.2004	1.2535
Recovery, per cent	65.07	64.49
Copper output, pounds	54,739,678	52,724,053
Cost per pound, cents	16.814	15.047

Increases in smelting and refining, freight, and wages resulted in the above higher costs.

NEW MEXICO

Santa Rita.—Chino Copper reports the following for the third quarter of 1918, compared with the second:

	Third quarter	Second quarter
Net profit	$1,035,749	$1,916,513
Dividends	869,980	869,980
Surplus	$ 165,769	$1,046,533
Overburden moved, cubic yards	773,776	940,057
Ore milled, tons	932,000	901,500
Copper content, per cent	1.6233	1.5773
Copper recovered, pounds	19,449,195	19,030,992
Cost per pound, cents	19.08	16.36

The higher cost is largely due to increased wages and sup-

DIAMOND-DRILL (SULLIVAN) AT BOTTOM OF NO. 3 SHAFT—980 FT. BELOW MAIN ADIT AND 1750 FT. BELOW THE OUTCROP OF MOGOLLON MINES CO., MOGOLLON, NEW MEXICO

plies, higher charges for smelting and refining, and increasing the charge for absorption of stripping expense into operating cost to 45c. per ton of ore milled.

WASHINGTON

Loon Lake.—The Loon Lake Copper Co., operating 50 miles north of Spokane, is floating a bond issue of $90,000 with which to build a mill. In the meantime ore from the mine is being shipped steadily by a lessee.

Two other properties are active in this locality. They are the Loon Lake Blue Bird and the Spokane Copper. The former company has installed a compressor and added a boiler and other equipment. The Spokane Copper is pushing development, having opened an excellent vein on the 110-ft. level.

CANADA

British Columbia

Rossland.—This centre has been severely hit by influenza. The mines are closed, and even the daily newspaper has ceased publication.

Stewart.—The community has suffered severely from influenza. With insufficient drugs, etc., and no doctor immediately available, patients not only were without skilled professional attention, but could not be given anything more than personal care. This was provided by the miners and prospectors of the surrounding districts, who suspended work for the purpose, all of the town being ill. In a mining way Stewart seems to be flourishing, local miners predicting that it is going to prove an extensive producer. The Bush property near Cascade creek, recently acquired from a New York syndicate by R. K. Neill, of Spokane, is spoken

of most optimistically. Mr. Neill is making arrangements for the transportation of ore this winter. The Nesbitt, George, and Lesley properties also are mentioned, and a new company was incorporated recently to work the latter group.

Surf Inlet.—The Belmont Surf Inlet Mines has milled 52,920 tons of ore, yielding $518,774, during the 6 months ended August 31. The profit was $179,171. The monthly tonnage has been up to 9407.

Ontario

Cobalt.—Subscriptions by mining companies to the Victory Loan are as follows:

Nipissing	$1,000,000
Kerr Lake	500,000
Temiskaming	400,000
Coniagas	90,000
Buffalo	50,000
McKinley	50,000
Trethewey	25,000
Total	$2,115,000

MEXICO

Mexico City.—Telegraphic advice from Mexico City to the United States, under date of November 13, stated that President Carranza had on that date signed a decree reforming the monetary system of Mexico by placing it on a strictly gold basis. The recent monetary crisis was caused by the exportation of silver half-peso pieces, which as the result of the high price of silver were worth more as bullion than as coin. Business has been seriously handicapped for a fortnight by the scarcity of change. Under the new decree peso and half-peso pieces will be coined with less silver in them, making their exportation profitless. New gold coins now being minted are worth two and a half pesos. Millions of pesos in silver and half-peso pieces, called 'tostones,' recently disappeared from circulation. These have been demonetized to prevent speculation in the new pesos. It will be illegal for any one to give more than twenty pesos of them as change.

The U. S. War Trade Board has issued the following note for exports from the United States to Mexico: In view of the increasing scarcity of many commodities of prime importance and necessity to the United States, which at the same time this Government desires to share with Mexico, it has become necessary for the Board to allot such commodities for export to Mexico, in order to equalize the distribution throughout the neighboring Republic in an equitable and orderly manner, consistent with the maximum amount of such commodities as can be spared. Prospective importers in Mexico will facilitate the granting of licenses for export by the Board by presenting copies of their orders for supplies in triplicate to the nearest American Consular officer, who will vise such orders and retain one copy for his file, returning the original and one copy to the applicant. The importer should forward both viséd orders to the prospective exporter in the United States, with instructions to attach the original viséd order to his application to the War Trade Board for an export license covering the commodity specified in such order, or file the original viséd order with the Board at Washington, and thereafter, in filing applications for licenses to export the commodities specified on such order, refer to the order by the Consulate stamp serial number, which will be affixed to the order, and also the Consular address, as 'Mazatlan, Serial No. 4782.' In cases where American Consular officers are not easily accessible to the prospective importer, a statement to that effect should be attached to the order, giving the name of the nearest place where a Consular officer is stationed.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

George H. Garrey is at Tonopah, Nevada.

Charles Janin has returned from Washington.

Charles W. Stimpson, of Salt Lake City, is at New York.

F. Le Roi Thurmond, of Anchorage, Alaska, is now at Seattle.

Clarence Woods has moved from Virginia to Dragoon, Arizona.

J. F. Abbema, of Oakland, is now with the Cinco Minas company in Jalisco, Mexico.

George O. Bradley is expected in San Francisco on his return from British Columbia.

Robert Hay Anderson has gone to New York, expecting shortly to return to Mexico City.

C. Terry du Rell has been commissioned Captain of Engineers with the 403rd Engineers at Fort Douglas.

Arthur Feust, who is now at Chicago, is working with the Industrial Survey branch of the War Industries Board.

George S. Backus, formerly of Leadville, Colorado, is now with the Minerals Separation American Syndicate, Ltd., in San Francisco.

John W. Moule has left the Great Cobar company to become assistant manager for the Burma Corporation, Ltd., at Namtu, Burma.

E. A. Cappelen Smith, consulting metallurgical engineer to the Chile Exploration Co. and Braden Copper Co., has been elected vice-president of both companies.

Frank H. Probert, Professor of Mining in the University of California, has been appointed a member of the National Committee on Minerals and has gone to Washington.

Walter V. Fox is now general manager for the War Mining & Milling Co., operating a zinc mine and plant at Lincolnville, Oklahoma, and a gold property near Idaho Springs, Colorado.

F. L. Longworth, until recently smelter superintendent for the Canada Copper Corporation, at Greenwood, B. C., has become superintendent of the Tennessee Copper Co.'s smelter at Copperhill, Tennessee.

Lee B. Davenport, for eight years in charge of the Goldfield Consolidated refinery, at Goldfield, Nevada, has resigned, on account of the altitude, and is now at Oakland, California.

Obituary

H. P. Corliss, the discoverer of alpha-naphthalamine as a flotative agent, died of pneumonia, after influenza, at Ray, Arizona, on November 16. He was a brilliant technician and gave promise of being greatly useful to the metallurgical development of the flotation process.

Bruce White, pioneer mine operator in British Columbia, is a victim of the influenza epidemic. Mr. White was one of the discoverers of the Slocan Star mine, later known as the Silversmith, from which over $3,000,000 in ore has been taken. At the time of his demise Mr. White was manager of the Noonday Mines at Sandon, B. C.

Frederick A. Hale Jr. died of influenza at Good Springs, Nevada, on November 17. He was a native of Denver and only 31 years old. A graduate of Stanford University and of the Utah University Mining School, he had proved himself a capable engineer both in Idaho and Nevada. He was manager of the Yellow Pine Mining Co., a profitable zinc producer.

THE METAL MARKET

METAL PRICES

San Francisco, November 26

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	11.00
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	8.30—8.80
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$120
Spelter, cents per pound	11.00
Zinc-dust, cents per pound	16.00

The War Trade Board announced on November 19 the removal from the export conservation list, effective at once, of dental platinum, iridium, palladium, platinum, and rhodium. The New York Assay Office handled the entire platinum requirements of the Government during the War, nearly 60,000 oz. being dealt with.

ORE PRICES

November 26

Chrome, no definite quotations available.	
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% MoS_2	$1.25
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, per unit	$20—$26

The War Trade Board announced on November 9 that all outstanding licenses for the importation of chrome ore, except those covering shipment from Cuba, Canada, and Brazil, are revoked as to shipment from abroad after November 11. Hereafter no licenses will be issued for the importation of chrome ore, except licenses covering shipments from Cuba, Canada, and Brazil.

EASTERN METAL MARKET

(By wire from New York)

November 26.—Copper is quiet. Lead is firm. Spelter is more active and stronger.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government has fixed its maximum at 49½ pence.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, which have since been extended to January 1, 1919, prices to be effective on the day of shipment, not the day of sale. Quotations in cents per pound are as under:

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefore $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

ORES (New York)

Antimony: No development in this ore.

Molybdenite: This market is also quiet with no demand to gauge the idea of buyers and sellers.

Manganese Alloys: At a meeting last week of ferro-manganese producers in New York it was agreed to maintain indefinitely the price of 70% alloy at $250, delivered. Spiegeleisen, 16%, is quoted now at $70, furnace. There is hardly any demand for either. After January 1 all restrictions recommended last May as to 70% ferro and 16% spiegel being regarded as good delivery on all contracts for standard grades, have been withdrawn by the Committee on Steel and Steel Products.

Tungsten: A meeting of the tungsten interests was to be held in New York on November 25. The market is quiet and there has been no list of prices.

Eastern Metal Market

New York, November 20.

The assurance of peace has caused no flurry in the markets, demand being light in the open markets and no excitement in those under control.

Copper prices and conditions are to remain as they have been until January 1.

Tin is practically a controlled market, with the major part of the buying done by one company. Outside of this there is little buying.

Lead continues under control as to distribution and prices.

Zinc is an open market with demand light and prices lower.

Antimony has again declined.

In the steel trade the whole scheme of priorities, apart from those on merchant ship, railroad, and navy material, has been abrogated by the authorities at Washington; and thus there is restored at one stroke a substantially free market. Cancellations of war work have appeared extensively. The industry, however, is hopeful for several reasons; but it is not yet certain whether sufficient new orders will come in during the next month or two to make good the depletion. The 40,915 cars and 1500 locomotives ordered last month for the American forces in France have been cancelled, and about 300,000 tons of rails for the same purpose have been held-up. There have been numerous cancellations of shell-steel and wire. The British policy is to stop everything that is not more than 90% finished and to realize on it at its scrap value. A mutual sentiment in favor of continued co-operation developed at the meeting in Washington last week of steel-makers and the War Industries Board, but the attitude of the railroad administration not to buy further until prices are lower was a disappointment.

COPPER

The situation as to prices has been settled until January 1 by an agreement entered into last week in Washington between the War Industries Board and the copper producers. It was also agreed that there should be no reduction in wages nor any slackening of output. Whether there will be an open market after that is a question. So far there are no reports of cancellations, and there is little expectation of any, particularly from allied countries. It is probable that the latter contracts can be applied to non-war uses. There has been no rush to buy copper from foreign sources, this being regarded as natural, for no matter how great the probable need there has been no chance to gauge this definitely. Unconfirmed rumors are to the effect that electrolytic copper has sold lower than the fixed price for delivery after January 1. Lower than the established price continues to be quoted for casting copper.

TIN

The only news feature of interest during last week has been the presentation yesterday to the War Industries Board at Washington by the Tin Importers' Association, Inc., of an alternative plan for controlling importation and sales of tin in this country. The feature of this plan is that the business would still be conducted by the present importers under licenses, the distribution being made through some such agency as the American Iron and Steel Institute. In this way the transition from war to peace could be easily conducted, and still the trade not be in the hands of the largest consumer of tin in the country. The Board has the matter under consideration. Buying of tin for future requirements on any scale is now being done under the new international control. American consumers are purchasing through the United States Steel Products Co., which purchases and sells the metal at cost, the distribution being through the American Iron and Steel Institute. Outside of this buying, which has probably been large, there is little demand for such resale lots in transit or arriving as are available. There is almost no open demand, and the price for spot delivery remains nominal at about 75c., New York. Importers are practically out of the business, except as they are granted licenses to import tin to fill contracts entered into prior to October 1. Tin arrivals thus far this month at Pacific ports have been 1125 tons, with 100 tons at Atlantic ports. In London spot Straits has fallen to £317 per ton, a decline of £17.

LEAD

Peace has had no effect on this market so far. It is realized that supplies are by no means ample, and that any relaxation of control would probably result in a decided advance in quotations. The Lead Producers' Committee continues to regulate sales and distribution with the price fixed at 7.75c., St. Louis, or 8.05c., New York. While some consumers expect a decline from these levels, there seems little likelihood of it for some time. The present control, which is voluntary and not Governmental, is expected to continue until early in 1919.

ZINC

This market has been uncontrolled throughout the War except, as to special grades, and has so far withstood the effect of the cessation of hostilities unusually well, and is regarded as a reflection of what might be the case in other markets. There has been no decided break in prices. As might be expected, demand has not been large since the armistice was announced. Prices eased-off gradually until yesterday prime Western was quoted at 8.15c., St. Louis, or 8.50c., New York, for early or November delivery, with December shipment held at 7.95c., St. Louis, or 8.30c., New York. For first quarter the nominal quotation is about 7.75c., St. Louis, or 8.10c., New York. Grade A zinc is still held at a maximum price of 12c. per lb. base. It could probably be bought considerably under this. Sheet-zinc has a maximum Government price of 15c. per lb., with plate-zinc at 14c. per pound.

ANTIMONY

The effect of peace continues to be felt in this market. It has declined again to 9 and 8.25c. per lb., duty paid, New York, for wholesale lots for early delivery. It is stated that sales have been made for delivery in January and February at 7.75c., New York, duty paid.

ALUMINUM

This market continues to be ruled by maximum Goverament prices, effective until February 1. For No. 1 virgin metal and for scrap in 50-ton lots, 33c. is the quotation, with 33.10c. per lb. asked for 15 to 50-ton lots, and 33.20c. per lb. for 1 to 15-ton lots.

The production of steel ingots in October, according to statistics compiled by the American Iron and Steel Institute from reports submitted by 29 companies, which made 85.10% of the total production of steel ingots in 1917, was at an annual rate of production of 46,699,360 tons, exceeding the revised September rate of production of 46,443,070 tons per year by 256,290 tons.

Company Reports

CRESSON CONSOLIDATED GOLD M. & M. CO.

Property: at Cripple Creek, Colorado.

Operating Officials: A. L. Blomfield, general manager; Luke Shepard, mine superintendent; L. S. Noble, consulting engineer.

Financial Statement: During the year ended August 31, 1918, the net revenue from ore sales was $1,628,188, plus $23,495 from royalty and interest. The profit was $1,205,386.

Dividends: 10c. per month was paid, equal to $1.20 per share, or $1,464,000. The total to date is $7,027,163.

Development: drifts, etc., totaled 8238 ft., plus 4540 ft. of diamond-drilling, and 886 ft. of work to connect the main shaft and the 1603 orebodies with the Roosevelt drainage-tunnel. The most interesting features resulting from the year's operations are: (1) Discovery of new orebodies on the third, fourth, and fifth levels on the vein systems of the Funeral and Sliver dikes; (2) discovery of new orebodies of substantial size and value on the seventh, eighth, ninth, and tenth levels, in the centre of the volcanic crater (the past development and ore discoveries in the eruptive area have all been limited to the contact or exterior boundaries of the crater); and (3) discovery on the Roosevelt tunnel-level of orebodies on the downward extension, and increase in size and value of the ore measures heretofore disclosed on the sixteenth, or deepest level of the Cresson, 175 ft. above the tunnel. Ore-reserves on August 31 were estimated as worth $2,948,489.

Production: there was shipped 89,730 tons of ore, valued at $24.14 per ton. Lessees produced 1599 tons, which gave a royalty of $2539.

Costs: the increase amounted to about 60%.

DAVIS-DALY COPPER CO.

Property: 320 acres under the city of Butte, Montana.

Operating Officials: W. L. Creden, general manager.

Financial Statement: in the year ended June 30, 1918, the income was $1,400,219, mostly from ore sold. Expenditures totaled $818,081, leaving $582,138. Deductions and additions left a net profit of $457,490. Current assets totaled $522,205, and liabilities $69,929.

Dividend: an initial of 50c. per share was paid, equal to $300,000.

Development: Labor troubles have given the management the greatest concern, and at the present writing (October 9) no improvement is in sight. Wages have been increased, and with almost 100% increase in price of supplies, operating costs have advanced accordingly. Ventilation has been no small item of expense. Heat on the lower levels has been intense. Arrangements were made in December 1917 to connect by cross-cut the Colorado shaft with that of the Belmont of the Anaconda company. The distance between the two shafts is approximately 2500 ft., advance is slow, as the temperature in the cross-cut is 100°. Large and powerful fans are being put in the lower levels as a part of a permanent ventilating system. New equipment has been installed at the Colorado, notably a new electrically-driven hoist and compressor. Extensive improvements are contemplated that will facilitate mining and lower costs of production. Operations at the Hibernia have been active. This is primarily a silver-zinc mine, but it contains large quantities of manganese. Mining of this ore was undertaken for a period, but on account of inability to secure acceptable treatment of the ore production was stopped. Sinking the Hibernia shaft to the 600-ft. level was discontinued owing to the large inflow of water, which proved to be troublesome and expensive. This shaft has been equipped with an electrically-driven hoist and compressor. No coal is used at this plant. Questions of apex have arisen with the neighbors of the Hibernia, which means long and expensive development to prove the Davis-Daly claims, but the management is confident of the final outcome. One significant fact for the year with the Davis-Daly is its emerging from a developing mine to a producer.

Production: the two mines yielded as under:

	Colorado	Hibernia
Ore, tons	52,996	5,724
Copper, pounds	5,894,396	.....
Zinc, pounds	.....	1,316,310
Lead, pounds	.....	611,907
Silver, ounces	260,672	129,816
Gold, ounces	.....	356

The average grade of the copper ore was 6.597%.

ORIENTAL CONSOLIDATED MINING CO.

Property: mines and mills in the Unsan district of Korea.

Operating Officials: Alf Welhaven, general manager; T. W. Van Ess, assistant; J. B. Lower, superintendent of Tabowie, Taracol, Maibong, Chintui, and prospects; J. A. Vernon, assistant at Chintui and prospects; E. S. Barstow, superintendent of transportation; W. H. Aldridge, mechanical engineer; E. H. Emerson, electrical engineer; K. F. Hoefle, superintendent of fuel and timber railway; E. L. Power, medical officer; A. B. Palmer, cashier; C. A. Crispin, auditor; S. E. Iijima, secretary to general manager.

Financial Statement: revenue during the year ended June 30, 1918, totaled $1,528,525. Of this, $393,464 was profit. The surplus on June 30, 1917, was $230,684, and a year later $409,453, after paying dividend. Assets include cash in banks, $531,114; supplies, $453,514. Sundry debtors total $222,799.

Dividends: No. 36, amounting to $214,695, was paid in September 1917. This made $7,938,645 to that date. Since then another distribution has been made.

Development: in the five main mines a total of 34,697 ft. was done, 3000 ft. short of the previous year. On prospects, 1226 ft. was accomplished. Results at the Tabowie were unsatisfactory and discouraging; at the Taracol and Chintui satisfactory and encouraging; the Charabowie was worked out, while the Tongkol was not as good as expected. Work on outside areas was generally unsuccessful. Ore-reserves total 775,000 tons, valued at $5.27 per ton. The Tabowie contains 485,000 and the Taracol 238,000 tons.

Production: three mills—the Tabowie, Taracol, and Maibong—with 200 stamps, crushed 303,672 tons of $5.90 ore. The Maibong was shut-down permanently in July 1918. By amalgamation there was $845,142 saved. Concentrate treated at the Tabowie and Taracol plants amounted to 27,462 tons, yielding $600,729, or 83.2%. The Maibong tube-mill plant treated 2060 tons for $45,933, the recovery being 91%. The total extraction of gold was $1,493,318, equal to 90.3% of the gross value of the ore. Since work first started the yield has been $29,423,235 from 4,766,270 tons of ore.

General: total receipts were $5.03 per ton, operating costs $3.06, and construction 10 cents, leaving a profit of $1.87 per ton. The hydro-electric plant worked 342 days, generating 588 hp. per day. Okura & Co.'s power supply was unsatisfactory, and has been discontinued. The Oriental Consolidated has now to construct a plant to cost $425,000. This will enable lower-grade ore to be treated more profitably than at present. The rainfall was 66 inches. The forestry department planted 220,000 trees of various kinds. The Taracol free bath-house continues to be popular, 88,862 baths being taken during the year. The medical staff gave 20,813 treatments, 13,512 being company employees. A charge of 5 cents to outsiders kept away many idle curious. The report, as usual, is full of interesting cost data.

Book Reviews

Mineralogy, Blowpipe Analysis, and Crystallography. By G. M. Butler. Pp. 546, ill., charts, indexes. John Wiley & Sons, New York, 1918. For sale by 'Mining and Scientific Press'. Price, $3.50.

This new work consists of three books in one, namely: 'A Pocket-Book of Minerals', second edition, of 311 pages; 'Handbook of Blowpipe Analysis', first edition, of 80 pages; and 'A Manual of Geometrical Crystallography', first edition, of 155 pages. The blowpipe section is a reprint of the practical little book that first appeared in 1910. We fail to see how any one with a slight knowledge of minerals and chemistry could fail to follow the instructions and obtain satisfactory results. The blowpipe is being used more and more in field work, naturally on account of the search for the rarer minerals.——In concise form, in the part devoted to mineralogy (under the headings lustre, color, streak, fracture, occurrence, and varieties), are to be found the native elements, sulphides, sulpho-salts, halogen salts, oxides, sesquioxides, intermediate oxides, dioxides, hydrous oxides, and sulphates, anhydrous carbonates, sulphates, and silicates, hydrous silicates, phosphates, arsenates, chromates, and hydrocarbons. The important features are in bold-face type. A list is given of commercially important ores and some useful tables. Although blowpipe work follows this mineralogy, a line under each mineral could easily have given the color by bead test.——Crystallography is useful for two purposes, (1) to be able to detect the difference between crystals, and (2) to be able to recognize crystal forms and systems. The author says that the 'sight recognition' of minerals is now a growing instruction, and his explanations are with this end in view. Those interested in crystallography will find this part well discussed. Altogether, these three books in one should be of considerable use to any one in the field, also in the laboratory.

Chemical Combinations Among Metals. By Michele Giua and Clara Giua-Lollini, and translated from the Italian by G. W. Robinson. Pp. 341, ill., index. P. Blakiston's Son & Co., Philadelphia, 1918. For sale by 'Mining and Scientific Press'. Price, $4.50.

To review this work adequately would require strenuous study and parallel reading. It is rather a symposium on the subject, and there is a paucity of views by the authors. There is not sufficient connection between the various conceptions. Many of the chemists' names given are not known in America, although that does not lessen the value of their ideas. The matter is thoroughly portrayed, and is made easier to understand by the numerous charts. A personal investigation is necessary to follow it all, but later somebody must integrate the theories given. It is a highly technical work, and is of use mainly to investigating chemists, although it will be found useful in chemical calculations. An idea of the matter covered may be gained from the chapter headings, namely: 'Equilibrium Diagrams', 'Thermal Analysis', 'Nature of Inter-Metallic Compounds', 'Physical Properties', 'Homopolar Inter-Metallic Compounds', 'Heteropolar Inter-Metallic Compounds', and 'Ternary Inter-Metallic Compounds'. Following are examples taken at random:

Silver-gold-tellurium: This system has recently been investigated by Pellini, who has directed his researches in particular to the system $Ag_2Te.AuTe_2.Te$, and succeeded in defining the compound $(AgAu)_2Te_2$, in which gold partly replaces silver. The experimental study of this system presented difficulty, for the thermal phenomena were not always well defined. The ternary compound does not separate directly, but melts with decomposition. The investigation of all the states of equilibrium in this system is by no means complete, and the complications that occur in the binary systems comprised in it vastly increase the difficulties of thermal investigation. The possibility of the formation of ternary compounds of silver, gold, and tellurium seems evident when it is considered that such compounds occur naturally. Gastaldi has recently described such a compound, to which he gives the formula $(AgAu)_2Te_3$. These ternary combinations of course belong to the group of heteropolar compounds. If they result from the union of dissimilar atoms, the part substitution of an electro-positive element by another closely-related element is always possible. No other ternary combinations have as yet been deduced from the study of equilibrium diagrams. From the physico-chemical point of view these compounds are only known to a very small degree owing to the lack of systematic researches, as is the case in so many binary combinations.

Lead-bismuth: It is doubtful whether chemical combination occurs between lead and bismuth. The system has been studied by Mazzotto, Kapp, Stoffel, and Barlow. The two branches of which the equilibrium curve consists intersect at 125° and 55% bismuth. According to Kapp, the thermal effects corresponding to eutectic crystallization occur from 36 to 98% of bismuth, which would show that up to 36% of bismuth solid solutions are formed.

Zinc-iron: Iron forms with zinc the compounds Zn_7Fe and Zn_3Fe. There are also three series of mixed crystals. The system has been studied by Wologdine, Guertler, von Vegesack, and finally by Raydt and Tammann. At 777° and 25% of iron the melt separates the compound Zn_3Fe which undergoes a transformation to the compound Zn_7Fe at 662° and 15% iron. As above mentioned there are three species of mixed crystals, one up to 0.7% of iron, the second from 7.3 to 11% of iron, and the third from 80 to 100% of iron. From 25 to 86%, the alloys consist of saturated mixed crystals and the compound Zn_3Fe; from 25 to 15% of the two compounds Zn_3Fe and Zn_7Fe; and from 7.3 to 0.7% of the two saturated mixed crystals. Magnetic properties are observed in alloys from 26.2 to 96% of iron; such properties diminish in intensity with decrease of iron content. The alloys with 11 to 22% of iron containing the two compounds are exceptional. Probably their properties are due to the presence of small quantities of iron. On heating, such alloys lose their magnetic properties. The iron-zinc alloys are porous, hard, and very brittle.

Gold-zinc: Gold and zinc form the following compounds: $AuZn$, Au_2Zn_3, and $AuZn_8$. The system was studied by Vogel. At 50% zinc and 744° there is a maximum corresponding to the compound AuZn which, by reaction with the melt, gives mixed crystals with gold and zinc. Between 50 and 63% of zinc, mixed crystals separate with a higher content of zinc than is demanded by the formula $AuZn_3$, and at about 650° a homogeneous substance crystallizes which is the compound of the formula Au_3Zn_8. At 486° saturated mixed crystals are changed into a third compound. The maximal transformation is at 88% of zinc corresponding to the formula $AuZn_8$. Here a new series of mixed crystals occurs. Alloys rich in gold have the same hardness as that metal, are less tenacious, and not at all brittle. At above 31% of zinc the alloys show considerable hardness and brittleness. After 61% they become gradually less hard and brittle.

Copper-zinc: Copper combines with zinc, forming the two compounds Cu_2Zn_3 and $CuZn$. The equilibrium diagram of these alloys has been investigated by Roberts-Austen, Shepherd, Tafel, Carpenter and Edwards, and lastly by Parravano. Cu_2Zn_3 separates at 833° and 60% zinc, and $CuZn$ at 1005° and about 50%. It was noted that the region of existence of this latter compound became more restricted with fall of temperature.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

THE MINER AND THE AMERICAN RED CROSS

No one is able to appreciate the suffering of others like those who have suffered themselves; likewise, no one appreciates the need of relief agencies like those who have once been in a position to need relief. That is why the miners of this country can so thoroughly understand and appreciate the work of the American Red Cross. At all times this organization has furnished prompt aid whenever there has been a mine accident. Whenever the call has come, doctors and nurses have been hurried to the scene of the accident. And so it was that when the call came for Red Cross contributions in the great war fund drive last year miners responded by offering one day's wage. No working men have a more vital part to play in this War than the miners. During the week of December 16 to 23, a national 'paper is to be taken'. This is the Red Cross Christmas roll-call when every man, woman, and child is to be given the opportunity to support by his membership and his service this national organization for military and civilian relief. Women of the mining centres will also have a big part to play in this work.

A COAL-MINER BEING TRAINED AS A MINE-LAMP REPAIRER

HELPING THE CRIPPLED SOLDIER

By Elisabeth Tredwell Stebbins

*To a greater or lesser degree in the past, the mining industry has had to face the problem of the disposition of men crippled through accident while on duty. Generally they have been retained to do odd jobs, but there has been no real interest in finding out what these handicapped men could do in competition with their non-handicapped fellow-workers. These odd jobs have often been nothing more nor less than charity not any too carefully disguised. Often the job has been so easy that no self-respecting man would care to fill it, with the result that the holder of the position became discouraged and lost his grip on things almost as soon as if he had received his envelope for living in absolute idleness.

This is not the fate we should anticipate for our men who are serving us so gloriously 'over there'. Some of them will return, to all intents and purposes, the same as they left. Many of them, and these are the ones for whom we must plan, will return with physical disabilities. These men will want a chance in the mining industry as well as in many others.

Before considering positions in which a cripple may be an efficient worker in mining, let us look at some of the things that have been accomplished by the disabled. In 1881, a famous Frenchman, Daniel Vierge, was recognized as one of the world's best draughtsmen. Suddenly a stroke of paralysis bereft him of the use of his right hand. Nevertheless a few years later he was doing with his left hand far better work than he had ever executed with his right. Another example: Ivan, an unskilled Russian laborer, enlisted in the British Army and was disabled in battle. During the first month of his re-education as carpenter at Whitby, Canada, he constructed the model of a house, five feet high. He had no previous experience in woodwork. And then there is Michael J. Dowling of Minnesota. Through an accident he lost both legs, his right arm, and the fingers of his left hand, but he drives his car, rides horseback, and enjoys life. He does not consider himself a cripple and no one else would consider him such. These examples of what handicapped men are doing could be multiplied. It is the purpose of this account to explain how the crippled man can fill certain positions, and doubtless the mining engineer will immediately think of others to which a disabled man can adapt himself.

There are two varieties of artificial limbs—the dress arm and leg, and the work arm and leg. The two former are modeled on human lines, and are usually worn for the sake of appearance. The work arm, however, is a wonderful appliance. It is made to fit not only the individual using it, but also the use to which it will be put. Usually it is of metal with a device at the end for receiving attachments calculated for various operations.

The occupations to be mentioned bring to mind a strong and hearty man, but closer examination shows that none of the positions exercise all parts of the body. To be a trap-door tender or an oiler requires but one arm, supplemented by a portion of the other forearm or a work-arm. The engineer in charge of a hoisting-engine would never be hampered by the loss of a leg if his arms are intact. The work of a bank-boss or a foreman depends largely on the man's mentality. One strong arm would meet the physical requirements of these positions. From our early school-days, we have been accustomed to think of the blacksmith as a "mighty man", but it was the "muscles of his brawny

*Furnished to the 'Mining and Scientific Press' by the Publicity Department of the Red Cross Institute for Crippled and Disabled Men, 311 Fourth avenue, New York.

arms" that were pointed out for admiration. For all we know he may have had a wooden leg.

As in other industries, the office force may be drawn from the handicapped. All lines of clerical work are being done by the one-armed and their wages show that they are making good. As a matter of fact there is a certain accountant who has lost two arms. He does his work with artificial equipments. Any one can see that in office work, legs are only used as a means of locomotion. A legless man can be just as efficient in any clerical position as a man with both legs. The cripple is no longer handicapped. On the contrary, he will be made more efficient provided the job toward which he has an inclination is found and he is trained to fill it. He does not want sympathy of the wrong sort, he wants encouragement.

According to the Vocational Rehabilitation Act recently enacted by Congress those disabled in the military and naval forces of the United States have been placed under the joint authority of the Surgeon General of the Army and the Federal Board for Vocational Education. The Surgeon General has jurisdiction from the time the person is injured until he is restored to good physical condition, when he receives his honorable discharge from the service. The Federal Board then offers him vocational re-education and training which will enable him to return to useful active employment, and the United States Employment Service will co-operate in finding him work.

AMBULANCE ARRIVING AT AN AMERICAN RED CROSS HOSPITAL IN FRANCE

COMMERCIAL PARAGRAPHS

The Chicago Pneumatic Tool Co. announces the appointment of A. M. Brown as district manager of sales at Philadelphia, to succeed G. A. Barden.

E. T. Lednum, formerly manager for the **E. I. du Pont de Nemours & Co.** at Joplin, Missouri, is now with the firm at the Ideal building, Denver, Colorado.

The Dixon Crucible Co., in its monthly 'Graphite' announces the death of A. R. Lloyd, for 20 years in the firm's Philadelphia district sales office. He was 52 years old.

In a leaflet the **O. F. Jordan Co.** of East Chicago, Indiana, shows the efficacy of its spreader in removing snow from railroad tracks. One machine is reported to have saved $4340 in one day, when compared with the work of 2500 men.

The October 'Duplex Doings', of the **Duplex Truck Co.** of Lansing, Michigan, shows what its machines can do. One went over the top of Mt. Helena, Montana, the rise being exceptionally steep; others are doing good work in hauling grain; while others bring in long sticks of timber over mountainous roads.

The Ruth Company of Denver, Colorado, has sent us a copy of its Bulletin No. 10, of 12 pages, describing the construction and operation of the Ruth patented flotation machine. The apparatus is built with a series of cells, all of which are on the same level. Each cell has a diffusing compartment and a spitzkasten. The compartment contains the 'spumer'—the air and pulp distributer—which causes the whole cell to function. The spumer is the heart of the machine. There are no valves.

The E. I. du Pont de Nemours & Co. states that on November 19 the War Trade Board removed the embargo that prohibited the exportation of the higher-strength dynamites and ammonia-base dynamites. This means that you are now permitted to export ammonia dynamites and dynamites containing a greater nitro-glycerine content than 40%; in other words, you will now be permitted to export higher-strength dynamites than Du Pont 50% gelatin, Du Pont 42% gelignite, and Du Pont 40% nitro-glycerine dynamite, as well as the ammonia dynamites. All licenses that expired on November 15 or on subsequent dates will hold good until used.

In Bulletin 5, the **Allen Cone Co.** of El Paso, Texas, describes its patented cone. This apparatus is a classifier, de-slimer, and dewaterer. The special feature is an automatic float control, by which the spigot opening is regulated to discharge the settled sand only as fast as it accumulates. The cone is of the regular settling-basin type, operating without hydraulic water and making its classification by the upward flow of the water in the basin. This action is entirely automatic, and no power is required. Four sizes are made, from 3½ ft. diameter at overflow lip and 5 ft. 2 in. high, to 8 ft. diameter and 9 ft. 11 in. high. To protect the cone from acid solutions, it is lined by concrete. Allen cones are used by the Old Dominion, Mine La Motte, Burro Mountain, Shannon, Picher, St. Joseph, Arizona Copper, and Presidio companies, dressing vanner feed, flotation feed, desliming, dewatering, in the re-grinding circuit, etc. An interesting operation of the Allen cones is the building of a tailing-dam 1150 ft. long at the Old Dominion at Globe, Arizona. The cones are on movable trucks. The cones remove the sand, which packs well.

AN INDEPENDENT WEEKLY PAPER OWNED, EDITED, AND MANAGED BY ENGINEERS

For Dewatering Slimes and Concentrates—

When you put in an installation for dewatering slimes or concentrates, the object is to **dewater,** to get them as dry as possible. Therefore, the most logical thing to do is to install a machine which most perfectly performs this service. That machine is the **American Continuous Suction Filter.**

It requires but little floor space and little headroom. It is extremely convenient and accessible and has over double the capacity of other vacuum filters per unit of space occupied.

¶ Our engineering staff is at your service to assist you in solving your filter problems. Ask for descriptive literature.

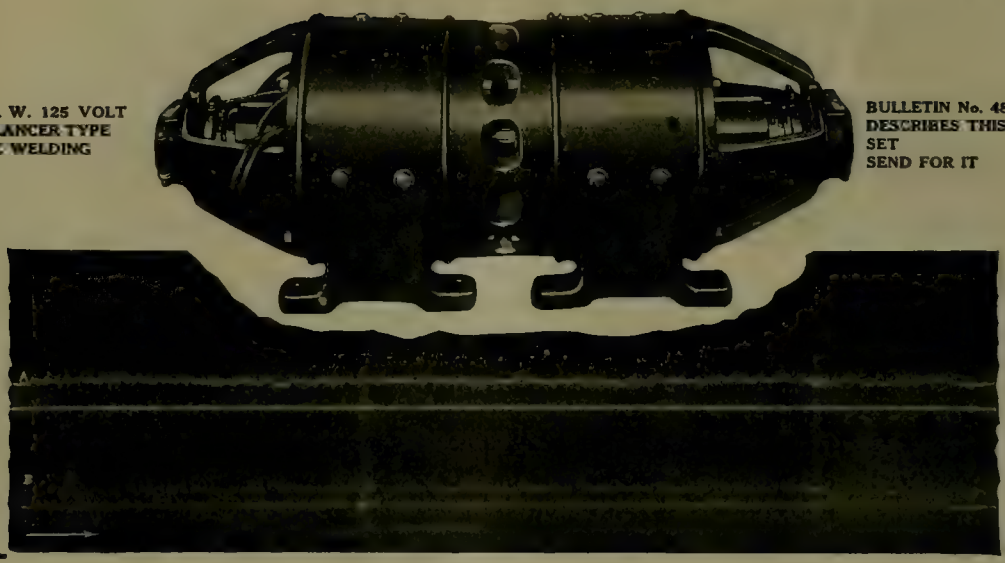
3 K. W. 125 VOLT BALANCER TYPE ARC WELDING SET



BULLETIN No. 48940 DESCRIBES THIS SET SEND FOR IT

Oscillograph curve, showing electrical conditions in welding circuit of constant energy arc welding equipment.
Curve "A" shows current in arc, approximate average value 150 amps.
Curve "B" shows voltage across arc, approximate average value 15 volts.

Steady flow of metal assured by efficient and simple G-E Welders

G-E constant energy arc welding sets are used to secure a steady flow of metal into the weld and high operating efficiency.

A constant flow of metal is assured by the inherent automatic regulation of the energy in the welding circuit throughout the welding range for metal electrodes.

The distribution of welding current between the two units comprising the set and practically dispensing with external resistance in series with arc, assures high efficiency.

One small panel and the set illustrated are all the equipment needed for a one-man outfit where operator has mask and electrode with flexible cable—if 125 volt direct current is available.

Consistently perfect welds are being produced in essential war industries by the use of this equipment.

We are prepared to demonstrate these sets and make good deliveries

TO make November 11 an international holiday, in order to celebrate the successful termination of the War, is a natural suggestion, but that would give us three holidays in one month, the other two being Election Day and Thanksgiving. It would be a good idea to fix Thanksgiving day on November 11 and so combine the thankfulness after harvest with that for our deliverance from the threat of Prussian bondage.

OFFICIAL statistics show that 14,661 officers and men in the British merchant marine and in the fishing industry were killed and 3295 were taken prisoner "while pursuing their ordinary vocation" by the Germans. This does not include the passengers—men, women, and children—murdered by the pirates during their submarine campaign, which failed in everything except in embalming the name of Germany in shame.

THE committee appointed by the Secretary of the Interior to make a study of American gold mining in relation to the increased cost of operations and the decreased output, and to suggest measures of relief, is said to be nearly ready to report. This committee consists of Messrs. Hennen Jennings (chairman), J. H. Mackenzie, Charles Janin, H. D. McCaskey, and F. L. Ransome. The first three represent the Bureau of Mines; the last two, the Geological Survey.

ANNOUNCEMENT is made by the U. S. Bureau of Mines that furloughs for mining men have been discontinued and that the general demobilization will suffice to release those urgently needed for industry. Steps will be taken immediately to return metal miners to their work. The Bureau desires to learn the names and addresses of any key-men for whom mining companies wish to secure prompt discharge. Such information should be sent to Mr. Edwin Higgins, Certifying Advisor, at 625 Market Street, San Francisco.

NEW YORK, Chicago, and Salt Lake City are reported to have passed an ordinance forbidding the display of the red flag. This represents a worthy expression of civic opinion. Those that "see red" should be invited to join their Bolshevist friends in Russia and Germany, or their nearer I. W. W. friends whom a judge at Chicago recently sentenced to a life of seclusion. There is no room for them in the open air of this country.

POTASH is the subject of a comprehensive article appearing in this issue. It is written by Mr. Frederick W. Brown of the Bureau of Soils and summarizes admirably the principal facts governing the consumption and supply of this chemical substance. We are amused by a paragraph appearing recently in the 'Wall Street Journal' suggesting that our domestic production of potash should not be developed "to the point where a high protective tariff would be required" because forsooth it might interfere with the utilization of the potash deposits of Alsace and thereby hinder France in recouping herself for her losses in the War. This looks like a sly bit of German propaganda.

UPON another page we publish extracts from the correspondence between the superintendent and the general manager for a mining company whose working force was afflicted by the influenza. It will remind many engineers of their own experience and will illustrate to what extent mining operations have been crippled by this black plague. Mr. Charles A. Chase, of the Liberty Bell mine, is well known to many of our readers. Mr. Douglas Muir was formerly on the staff of the Guanajuato Reduction & Mines Company in Mexico; his wife is the daughter of Mr. Bernard MacDonald. It appears that the influenza has been particularly hard on those living at high altitudes, as in Colorado. Mr. Sidney J. Jennings, while recently in San Francisco, stated that 34 out of 200 technical men on the staff of the United States Smelting, Refining & Mining Company had fallen victims to the epidemic. More soldiers in the Army at home were killed by it than died in action abroad.

WE note that the 'Mining Congress Journal' finds fault with a recent expression of opinion in these pages expressing keen dissatisfaction with the muddle made at Washington in the attempt to stimulate the production of chromite, manganese, and other war minerals. The spokesman for that eminently useful organization, the American Mining Congress, says that if there be men engaged in the Government's service "who represent primarily the interested industries" and if there

be cases where such service has provided "a camouflage of patriotism for the profiteers," if these things be, "the 'Mining Congress Journal' does not know of them." Then the gentleman is lacking in powers of observation; but this we do not believe to be the case, therefore we are compelled to conclude that he is prompted by diplomacy to asseverate his innocence of such knowledge. Evidently he shuts his eyes to many things in order to ensure a quiet life at Washington amid the mismanagement, inefficiency, and misdoings that have marked some, but not many, of the clumsy efforts to control mineral production during the War period. By the way, we thank him for reproducing our supposedly errant editorial, which must have appealed to many of his own readers.

RECENT disclosures all tend to confirm the conclusion that Germany was guilty of provoking the War. When the London 'Times', on July 28, 1917, gave an account of the meeting at Potsdam on July 5, 1914, at which the Kaiser and his party determined to force Russia and France into war, it was denied indignantly in Germany. Now the republican government of Bavaria publishes documentary evidence of the criminal purpose in order to prove complicity between Munich, Berlin, and Vienna. On this the 'Vorwaerts' of Berlin exclaims: "We were told that the German government did not know about the Austrian ultimatum beforehand. It is a lie. We were told that Berlin had expected Vienna to exercise moderation. It is a lie." It is indeed, as are so many of the other things said with great dignity and solemnity by the chancellors and foreign secretaries of the Central Powers. In due course the successors to William Hohenzollern & Co. will discover the diplomatic archives and uncover their contents to the world as the Bolshevists did at Petrograd, and when that happens we shall be treated to many proofs of German turpitude, and feel further satisfaction in finding that the inferences made from fragmentary evidence in 1914 have proved accurate.

PROTESTS have been made against any proposal to feed the Germans at the expense of the Allied peoples. We are informed that when the subject arose for discussion before the recent conference, in Washington, of the Food Commissioners from the various States, Mr. Ralph P. Merritt stated plainly that the people of California would refuse to stint themselves for the sake of those responsible for the War, and that Mr. Hoover hastened to disabuse those present of any idea that the Germans were to obtain food gratuitously so long as the peoples of the Allied countries were in need. When the Belgians, the Serbians, the French, the Poles, and the Russians have been cared for, then arrangements will be made permitting the Germans and Austrians to buy food at reasonable prices. The task is a big one and it will tax even Mr. Hoover's extraordinary executive ability, for 300 millions among the regions devastated by the Germans and Austrians are looking for help as against only 50 millions needing help in the enemy countries. The call for conservation is not based upon any idea of feeding either the people of Germany or of Austria.

LEGISLATION excluding undesirable immigrants has been enacted and is to be enforced by the Department of Labor. By this new law, signed by the President on October 16, all anarchists are to be kept out of the country, also those who are known to hold the anti-social and destructive opinions connoted by Bolshevism and the I. W. W. The new law provides that, irrespective of the time of entry of an alien into this country, he may be deported if he has acquired such beliefs since coming here. We welcome such legislation, for it is a flagrant absurdity to give domicile to those that purpose to subvert our domestic peace or to pull our political house to the ground. Now that the War has fused the diverse elements of our population into a united nation, it remains for us to deal summarily with the poisonous propaganda that may be brought hither from the disorderly elements in Europe. Here we note with approval the announcement that Germans and Austrians who served the cause of the Enemy in this country and were interned as dangerous aliens during the period of the War are to be deported as soon as the treaty of peace has been signed.

The Paper Embargo

On another page we print a circular just issued by the War Industries Board announcing the withdrawal of sundry regulations on the consumption of paper by periodicals such as ours. This circular recommends the retention of many of the regulations in force during the War because they have helped largely to diminish wasteful practices in the business of publishing. With this recommendation we are in entire accord, for it is a fact "that no other industry has held its wares so cheaply as that of the periodical publisher, or has practically given away so much of its product." We quote from the circular. This wastage has proceeded on "the theory that the amount of circulation, and not the quality, is the basis of advertising value." Such a theory was entirely fallacious and the prevalence of it suggests a misconception of their own interests by the advertisers, for example, those selling machinery and mining supplies. All readers are not buyers; subscribers in arrears are either too poor to pay or else careless, and in either case they are not potential customers for those using our pages as a means of publicity; the custom of counting free copies or sample copies as part of the effective publicity is a radical mistake; an indiscriminate exchange between periodicals only burdens the mail and bothers the editors, the recent regulation compelling each editorial department to subscribe for its exchanges has served to prevent waste and has put this courtesy on a proper basis; the sending of an unlimited number of free copies to advertisers is a trespass on good nature and another form of waste, because many of the copies serve no useful purpose. We hope that the exigencies of the War period will have taught

advertisers to discriminate between bulk circulation and effective publicity. No cut-and-dried method suffices to measure the publicity value of a periodical, not even the cash receipts on subscription account, because every subscriber is not a reader and every reader is not directly engaged in the industry to which the periodical ministers. One copy may be read by ten persons; ten copies may be set aside unread. Generally speaking, it is not until a periodical is read appreciatively and intensively that the reader looks over the advertising pages. The whole basis of the business of technical journalism, for it is a business allied to a profession, is the printing of matter that is interesting to a particular class or type of men engaged, directly or indirectly, in the industry to which the technology, discussed and described in the periodical, is devoted.

The Chrome Scandal

The outlook for specific relief to the chrome miners has been difficult to determine. The sudden declaration of an armistice produced a large degree of uncertainty in the minds of Government officials as to appropriate policies to be followed in readjusting industries. On every hand it was recognized that the period of war industry had ceased; that the object of continuing production of the materials formerly needed for actual warfare must be mainly to close the contracted obligations of the Government, and to some extent to preserve the military establishment in a state of preparedness for eventualities. An armistice is remote from peace; the political problems confronting the nations must be settled before we may fully rely upon a safe deliverance from the need of employing the Army for the final pacification of Europe. Nevertheless, the great demand for munitions is over, and everyone knew it was over as soon as Alsace-Lorraine had been occupied by Allied troops. This meant that the need of chrome ore would be reduced on the side of military requirements. The fact that the War Minerals Act must acquire a new significance the moment that the German envoys accepted the armistice was patent, yet the President exercised his authority under that Act on the very day when the armistice was signed. That was on November 11. As there was nothing mandatory in the statute, it is to attribute thoughtlessness to the President to assume that he should choose to exercise the powers granted to him, even to the extent of delegating his authority to the Secretary of the Interior, unless he had a clear purpose that the measure was still capable of being utilized for the good of the people. Indeed, one of the strongest characteristics of President Wilson is the deliberate purpose with which he performs his administrative duties. Although hostilities have ceased he has permitted a recent order for taking control of the trans-Atlantic cables to become operative, and the only warrant for doing so lies in the construction he may put upon the words "for the national security and defence," which were used in the statute under which the control of the cables is assumed. As a matter of fact the war is not over until a treaty of peace has been ratified and a presidential proclamation to that effect issued. There are some problems of national defence and security that are not automatically solved by the cessation of the clash of arms. The same phraseology is used in the War Minerals Act, and the President must have had this in mind when he signed his executive order. It would have been simpler to have done nothing than to complicate the situation by technically putting the Act into effect, unless there was a determination actually to utilize it. Naturally it was assumed that the War Minerals Act would be applied by the Bureau of Mines as soon as it was known that the administration of it had been lodged with the Department of the Interior. It is likely that it will be put into operation, but difficulties have arisen and these cause delay at least. It is evident that an interpretation of the statute, clear enough and reasonable enough to be defended on technical grounds, must be made before action can proceed. If this be done, the justification on moral grounds is so large that a man would place himself in the position of criticizing the Government for performing its duty if he were to attack the use of the statute for the relief of the producers of the so-called war minerals.

The hesitation to apply the statute has been so marked as to indicate that strong pressure has been exerted to alarm the Administration over the possibility of hostile criticism. This has led, in official circles, to a tendency to minimize the responsibility of the Government in encouraging the production of the war minerals. No one in either the Geological Survey or the Bureau of Mines denies responsibility for encouraging the output of these materials, nor do they deny that a moral obligation exists, but the question of an obligation sufficiently direct as to convert this encouragement into an engagement on the part of the Government to require owners of mines to lease the properties or produce the ore has been denied. Such a claim, however, can no longer be advanced since the presentation to the Secretary of the Interior of a copy of a letter from Mr. Hugh H. Sanford of the ferro-alloys division of the chemical and explosives section of the War Industries Board, addressed on May 4, 1918, to Messrs. Rowen and Barton of Grants Pass, Oregon. In this letter it was stated: "We understand that you have a group of claims on land containing chromite ore, which property you have optioned from Young and Darnell of Crescent City, Oregon. We understand that you are not operating this property yourself and have been unwilling to lease same on the basis of royalties offered. It is the desire and intention of the War Industries Board that all properties containing valuable deposits of chromite, that can be reasonably operated, shall be developed at an early date, and we are not willing that properties should be leased which are of value to the country, and should neither be operated by the lessor nor leased by him to another operator. We, of course, have no knowledge of all the facts regarding this property, but simply wish to express our point of view,

and wish further to ask you to advise us immediately in the first place what the true facts are in your opinion, and in the second place to let us know whether immediate arrangements can be made with parties for operating this property in a way that will make this Board satisfied that the ore will be produced as rapidly and efficiently as reasonable to expect. Your prompt attention will be appreciated." This letter effectually disposes of any argument that the Government was depending on a mere voluntary response to requests for production. The letter announces a definite policy of the War Industries Board that "all properties shall be developed," and it carries a threat of compulsion unless production be made. This is something more than a contract; under a contract there is a remedy in law; but in this case the Government assumes a responsibility for demanding production from any property that "reasonably" can be operated, which implies that it may be operated remuneratively. In the particular case to which this letter refers the property was leased, a few days later, to the California Chrome Company, which fact Mr. Sanford mentions in a telegram on June 12 as having learned "from a party yesterday."

The stumbling block in the statute, which has caused difficulty in coming to a decision, is the requirement that in applying it with regard to any of the minerals named a shortage of that mineral must be declared to exist. It is pointed out that a large stock of chromite is now on hand in this country. The production in the United States this year, stated in terms of 50% ore, will be slightly above 60,000 tons. The consumption is estimated as reaching, or perhaps exceeding, 95,000 tons. The estimated imports for the year are 87,504 tons. These figures are as nearly accurate as the Geological Survey now can ascertain. The domestic production from January 1 to September 30 was 48,590 tons, with imports for the same period of 74,708 tons. The total estimated available tonnage for the year therefore is 147,504 tons. Subtracting the consumption, it appears that there would be a balance accumulated as stocks on hand amounting to 52,504 tons. In the fact of this the claim is made that the stocks in storage in this country at the present time exceed 125,000. Whether that be true or not, it is evident that the consumers do not take the view, in their own councils, that there is an over-supply available, because persistent efforts have been made, since the President signed the executive order relating to the War Minerals Act, to break through the restrictions upon importation imposed by the War Trade Board, and to secure shipping and license for considerably in excess of 5000 tons of New Caledonian ore. If there is not a presumptive shortage in view of anticipated needs, it is hard to explain this eagerness to import more. Mr. Sanford attempted to explain it on the ground that the importers had bought it, and naturally wanted to have it delivered, but he did not explain why anyone should have bought 5000 tons of New Caledonian ore at a time when importation was absolutely prohibited and no reason existed for assuming that licenses to import could be secured. In the next place it is unlikely that any ore has been bought for which delivery based on prices paid has not been arranged through contracts for the finished product. It is also the expectation, as announced in the steel trade, and as further warranted by the effort of the Government to sustain the production of steel, that the consumption of chrome next year will be as large as during 1918, and the removal of restrictions may increase its use. On the other hand, in a free market there would be a tendency to demand higher-grade ore. The facts now available do not indicate that stocks are as excessive as they have been represented to be. In the event of complications arising before our return to a peace basis has been accomplished, there certainly would be no over-supply. The object of the bill was to provide "for the national security and defence," and the determination of shortage, in the meaning of the Act, is to be made in the light not only of a present but "a prospective inadequacy of supply," and this refers to a domestic supply of a material "formerly largely imported." This is standing on the technical construction of the measure, yet the fact is that this interpretation is no more straining the strict wording of the Act than it was to apply the Act under which the President has authorized Government control of the cables, put into effect after the armistice had been signed and its major terms largely fulfilled by Germany. If that be justifiable "for the national security and defence," how much more so is the application of a statute for further preparedness against possible difficulties, and at the same time discharging a high responsibility of the Government toward those whom it commanded to produce ores that would not have been touched except under these extraordinary circumstances.

Secretary Lane has stated that he is keenly aware of the responsibility of the Government, and is not disposed to shirk it, and it is probable that protection to the producers of chrome and of manganese will be given in some manner. A meeting of departmental and committee chiefs, consumers of chrome and manganese, and representatives of the producers of these substances, was held on Wednesday, November 27. On that occasion Mr. Lane suggested to the consumers that they purchase an amount of domestic ore proportioned to the tonnage imported. The consumers refused point-blank to do this; whereupon Mr. Lane intimated that some action might be expected under the War Minerals Act. The final word as to what shall be done will rest with the President, and, all other solutions failing, he may be called upon to determine the appropriateness of declaring a shortage in the meaning of the Act. The statute does not apply automatically to all the minerals mentioned in it. Each one must stand on its own merits and a declaration must be made that it is "necessary" as defined in the text of the Act. In the end, the great question involved is the honor of the Government, and this the Government will not disregard. The technicality of the law will admit of strict construction with so great a principle for its justification.

Chemical Analyses

The Editor:

Sir—Half, at least, of the published analyses of minerals and slags are worthless, because the chemist lacks the moral courage to report his results as he finds them. His ambition seems often to be to reach 100%, regardless of considerations of honor. This remark does not apply alone to the humble assayer, ill-equipped and inexperienced, but to men in high places, men of repute. Many analyses bear internal evidence of having been 'trimmed', to bring them to some recognized standard; others wind up with the too customary phrase, "water and loss," which in itself is an evidence of faulty work. To reach 100% is a poor ambition, but to ascertain accurately and state honestly the proportions of one, two, or a few constituents is worthy of the ablest chemist. Generally speaking, it would be better if the analyst would confine himself to those components which he has the facilities and the knowledge to discover and weigh rather than to proceed further to unknown depths in the investigation. No chemical analysis, no matter by whom made, is much more than an approximation. We should, therefore, not expect that the average manipulator will get close to the precise truth. Still, the shibboleth of '100%' has taken possession of him, and the chances are that some guesswork, some doctoring, will be done to his results.

I am moved to speak thus strongly because I have given myself to the study of furnace-slags, and have accumulated an immense number of published and contributed analyses. In doing so I have been much vexed with the unsatisfactory character of much of this material. Slags are oftentimes very complex in their composition, and contain substances not susceptible of exact estimation. Nevertheless, I find all the analyses footing up to the invariable 100%, eked out perhaps by 'water and loss'. As a matter of fact, the analysis of a slag is a difficult job, requiring time and considerable apparatus, as well as no small chemical knowledge; therefore it is no disgrace to a practitioner, especially a young one, not to reach perfection in such work. Even the qualitative examination of such a slag, embracing perhaps the discovery of twenty or more substances, is no small feat for beginners. They might, however, have the grace to report honestly what they find, and let it go at that. There are some glaring instances of carelessness, to call it by no worse a name, that have come to my notice through my examination of these analyses, which, if published, would reflect severely upon certain chemists of nation-wide celebrity. For example: A Government chemist, renowned for skill and accuracy, undertook the analysis of the so-called Ducktown slag, with all the resources of the Washington laboratories. His results, widely published, footed up to 100%, of course, but I notice that he left out the sulphur, as well as the oxygen that goes with the magnetic oxide of iron, which is always a constituent of such slags. Imagine his feelings if this were published with his name! It was not until within comparatively late years that chemists began to realize that sulphur and magnetic oxide were present in all such slags, and they were never computed in the earlier analyses. Nevertheless, the analyses footed up to the good old 100% just the same.

Conditions are quite as bad in mineral analyses. I have before me an analysis of feldspar that was copied out of Dana by an honorable gentleman, professedly a chemist, who got paid for making the analysis. Can you beat it? I do not imagine that the average chemist would sink to such depths, but I would like to impress it upon chemists in general if their published work is to amount to anything that, without reference to any standard, the constituents should be reported exactly as found. It is advantageous to know them all; but next to this we should know at least the principal ones as they are. It would be refreshing to meet with an analysis that overran 2 or 3, or even 5%; for then, we may be sure, there would be no question of 'water and loss'.

HERBERT LANG.

San Francisco, December 2.

The Chromite Scandal

The Editor:

Sir—Accept my thanks for the interest you have taken in the small chrome producers of the Coast. After reading the Government bulletin on chrome, and getting all data possible from other sources, I put all the money I had and then some into some chrome properties at Salmon Falls, in El Dorado county. These properties are now developed sufficiently to show up considerable ore, mostly low-grade, in fact, enough for a concentrator, but as things now look, I stand to lose my money, and most of a year's time. However, there is no use crying over spilled milk. I am now trying to locate a job at my old work of prospecting for dredging-ground.

F. L. BURNETT.

Folsom, California, November 13.

The Editor:

Sir—In coincidence with the country at large, and Mr. Blakemore's article in particular (in your issue of No-

vember 30), I wish to say that I am, or rather would be, a producer of manganese myself. On my own resources I got out, and still have, 17 tons of hand-picked ore at the loading-place; but, as soon as the unfair proceedings to the producers of chrome took place, I was not able to secure the capital that had been promised me to further the procedure. The importation of the ore from foreign countries is both unfair and unjust, and so surely as the American government had a right to demand the support and loyalty of her citizens in times of war, then just so surely have American citizens the right to demand protection from their government in times of peace.

DARIUS E. WELLS.

Rogue River, Oregon, November 29.

Platinum in Dunite

The Editor:

Sir—I trust you may find this communication acceptable. In the 'Mining Magazine' for September last there appears an article by E. Mackay Heriot touching on platinum in Spain. In your issue of November 9, you comment justly on it, and say it should be or is interesting to Californians. Now I wish to remind you and others of a similar discovery some years ago nearer home. On Oluime mountain, in British Columbia, Prof. Kemp of the U. S. Geological Survey discovered platinum in place in dunite, a variety of peridotite, as much as half an ounce per ton. For some years previous it had been collected with gold in the Tulameen river. Mr. Kemp trailed it to its source. In this belt the platinum is not confined to the peridotite. We found it in pyroscene and all the varieties of them, basic and acidic rocks, but nearly always mechanically combined with magnetic or chrome iron. I have pieces of it in my pocket now. I had assays from a trace to $108 per ton from picked pieces of chrome iron. We got gold nuggets of as much as four ounces, along with the river platinum, yet, strange as it looks, there has been no profitable gold ore found in that locality. The chrome iron carries diamonds so small that they are called 'dust', for they are of no commercial value but of as good quality as ever was found. There are some the size of an ordinary pinhead. Prof. Johnson, of the Canadian Geological Survey, will give full information on this subject. His address is Montreal. I must add that we got clean platinum as well as that connected with rock and iron from the river and half gold and half platinum mechanically combined, a few pieces.

J. C. REILLY.

Vancouver, B. C., November 25.

[We shall ask Prof. Kemp to enlighten us further on the subject. Our Victoria, B. C., correspondent has several times referred to the possibilities of platinum on the Tulameen river. Prospecting for the metal was stimulated by the Dominion Geological Survey. Holes were drilled to bedrock on bars and benches to determine the value of the ground. A Tacoma company erected a dam, flume, and centrifugal pumps and started to work the bed of the river.—EDITOR.]

The Embargo on Paper

The Director of the Pulp and Paper Division of the War Industries Board issued the following circular under date of November 27:

From today all rules and regulations of the Pulp and Paper Division affecting the publication of all periodicals excepting newspapers are withdrawn.

It is strongly recommended, however, that certain features of these regulations and recommendations be retained. During many years of sharply competitive business, various wasteful practices of circulation have developed, on the theory that the amount of circulation, and not the quality, is the basis for advertising value. Perhaps no other industry has held its wares so cheaply as that of the periodical publisher, or has practically given away so much of its product. Under the necessity of conserving all paper possible, the Pulp and Paper Division of the War Industries Board was compelled to eliminate these practices. These restrictions have not only conserved paper, but have proved profitable and beneficial to the publishers themselves, and after conference with representatives of the War Committee of the publishers in the periodical, business, agricultural, and religious fields, the following rules have been unanimously agreed upon as good business practice. Their adoption as trade customs is therefore strongly recommended by the War Industries Board.

RULES RECOMMENDED FOR ADOPTION AS TRADE CUSTOMS

1. Discontinue subscriptions after date of expiration, unless subscriptions are renewed and paid for.

2. Do not give free copies; except for actual services rendered; except to Camp Libraries and Huts of organizations recognized by the Government, such as the Y. M. C. A., Red Cross, etc.; except to the Library of Congress and other Libraries which will agree to bind for permanent keeping; except to Government Departmental Libraries which use said periodicals in their work; and except for similar reasons.

3. Discontinue all exchanges except where necessary for editorial purposes.

4. Do not give free copies to advertisers, or advertising agencies, except one copy each for checking purposes.

5. Do not exceed Post Office allowance of sample copies.

6. Do not take from subscribers less than published subscription price except in subscription clubs for same or for several publications. In either case, each publisher should receive at least seventy-five per cent (75%) of published price.

7. When premiums are given the premium should have a fixed price at which it will be sold separately; and the combined price received by the publisher should equal the announced price of the premium plus at least seventy-five per cent (75%) of the published price of the periodical.

8. Do not sell advertising with a guarantee of circulation requiring a rebate if circulation falls below guaranteed amount.

THE JANNEY FLOTATION MACHINES IN THE ARTHUR MILL

The Utah Copper Enterprise—VII

Flotation Practice

By T. A. RICKARD

TREATMENT OF VANNER CONCENTRATE. This goes first to two 44 by 20 ft. Dorr thickeners, which increase the density of the feed from 6 to 24. The thickened product passes to two emulsifiers and 13 Janney cells of the mechanical type. They are placed in series, stepping six inches. All that is visible of this machine is the hood, which contains the motor. The vent-holes for the field-cores make it look like a beehive, the emblem of Utah.

This machine for froth-flotation was designed by T. A. Janney at the Arthur mill, and is the result of systematic experimental work in which the inventor was assisted by his late father, Frank G. Janney, and his brother, Frank G. Janney, Jr. Two types of machine have been developed. One is the 'mechanical', this term being used to designate the kind of agitation it produces, in contradistinction to the other type, which is based upon the pneumatic, as well as the mechanical, principle.

The 'mechanical' Janney consists of a chamber (22 in. diam. by 26 in. high) in which revolves a shaft carrying two impellers, each having four blades set at an angle of 45° and revolving at 570 r.p.m. This stirrer is actuated by an electric motor, to which the shaft is directly connected. When ready for work the hood containing the motor is the only part of the machine that is visible. Four baffles are fixed around the periphery of the chamber, the lower impeller moving inside these baffles on a level about one inch from the bottom, while the upper impeller moves one inch above the baffles, the effect being to ensure a complete and violent agitation of the pulp. Besides stirring the pulp, the impellers induce a circulation from the chamber to the spitzkasten and return. The spitzkasten, a V-shaped base attached to each side of the principal mechanism, receives the pulp after it has undergone such stirring as will create the froth essential to the process. The froth rises to the surface of the pulp in the spitzkasten and is skimmed into a launder. The skimmer consists of a blade attached to an interrupted eccentric that while revolving drops

the blade into the froth so as to give first a vertical and then a horizontal motion, thereby avoiding the breaking of the froth. The amplitude of the sweep of this skimmer is regulated by the throw of the eccentric; the depth of the skimming is controlled by a bent rod to which the eccentric is attached and by which it is maintained in the desired position. An important feature of the invention is the circulation of the pulp. The feed enters through a gate at the bottom of the 'spitz' and is drawn, by displacement, into a pipe that takes it directly to the agitating-chamber; it is then thrown upward and outward near the top of the 'spitz'. Thus a constant circulation is maintained, the volume of pulp undergoing treatment being five or six times as much as the volume of feed or of discharge.

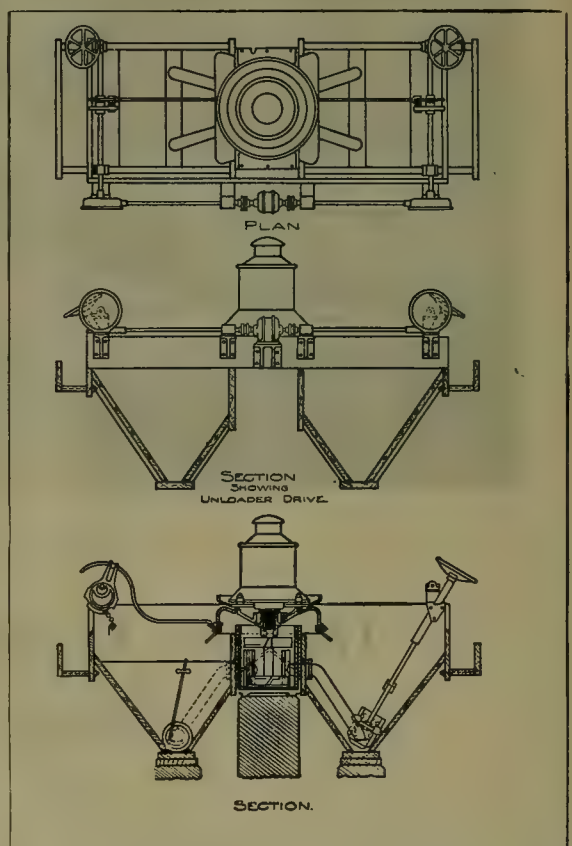
The 'mechanical-air' machine, as it is called, has the same kind of agitating-chamber, but the spitzkasten is provided with a porous bottom inclined at an angle of 35°. This porous bottom, or 'air-mat', is made of four plies of canvas through which air under a pressure of 3½ to 5 pounds is admitted. The air-pan is divided into three compartments, fed from corresponding pipes. The division is intended to compensate for the varying hydraulic head, thereby ensuring a uniform admission of air into the pulp.

The first machine in a series of either type of Janney equipment is used as a preliminary mixer, or 'emulsifier'. At this stage no metallurgical product is forthcoming. Here oil or other modifying agents are added just before the feed enters the mixer, and the pulp is prepared for the actual froth-making that follows in the second machine of the series, whatever the number of machines. The oil is added by means of a special device, designed to secure the constant feed necessary for the operations that are to follow.

From this mixer, or 'emulsifier', the pulp enters the 'mechanical-air' machine at the side of the agitating-chamber (above the lower impeller); thence it is ejected into the spitzkasten at a level higher than the inlet. In this chamber, which is open under the motor, there is an indrawing of air, as shown by a lighted match. In the 'spitz' the further aeration of the pulp is effected by the air that enters through the porous bottom, causing bubbles to be generated freely in the pulp, so as to buoy the particles of mineral to the surface.

The froth produced by the two types of machines differs notably, that of the 'mechanical' being denser and tougher than the froth in the 'mechanical-air', the product of which is more readily broken after it has been discharged, because, of course, once the froth has done its duty, it becomes a nuisance. The sooner it differentiates into liquid and solid the better. The reject of this operation descends over the air-mat to be returned by an interior pipe from each 'spitz' back to the agitating-chamber, the excess escaping over a weir into a launder or pipe that takes it to the next machine in the series. The froth from the 'roughing' machines is re-treated in the 'cleaners', to which it is pumped. The tailing from the 'cleaners' is pumped back and rejoins the feed to the 'roughers'. On the other hand, the reject from the 'mechanical' Janney goes direct to waste.

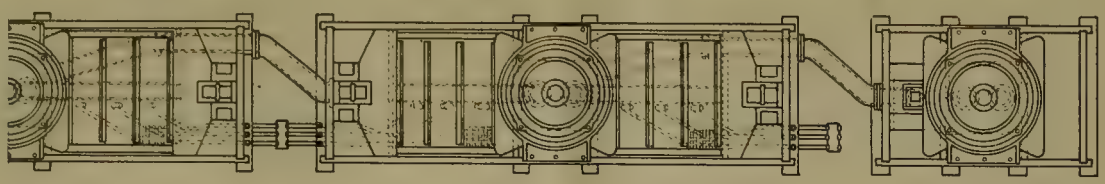
Turning to the drawing of the 'mechanical-air' machine, let us follow the flow of the pulp. It is fed at *A* and enters the opening *B*, part of it being thrown out at *C*, to rejoin *A*, producing a half-circulation at this stage. The other half is ejected at *D*, where the pulp drops into the box *E*, from which a portion is again drawn into the mixing-chamber through the pipe *F*, producing the other



JANNEY MECHANICAL FLOTATION MACHINE.

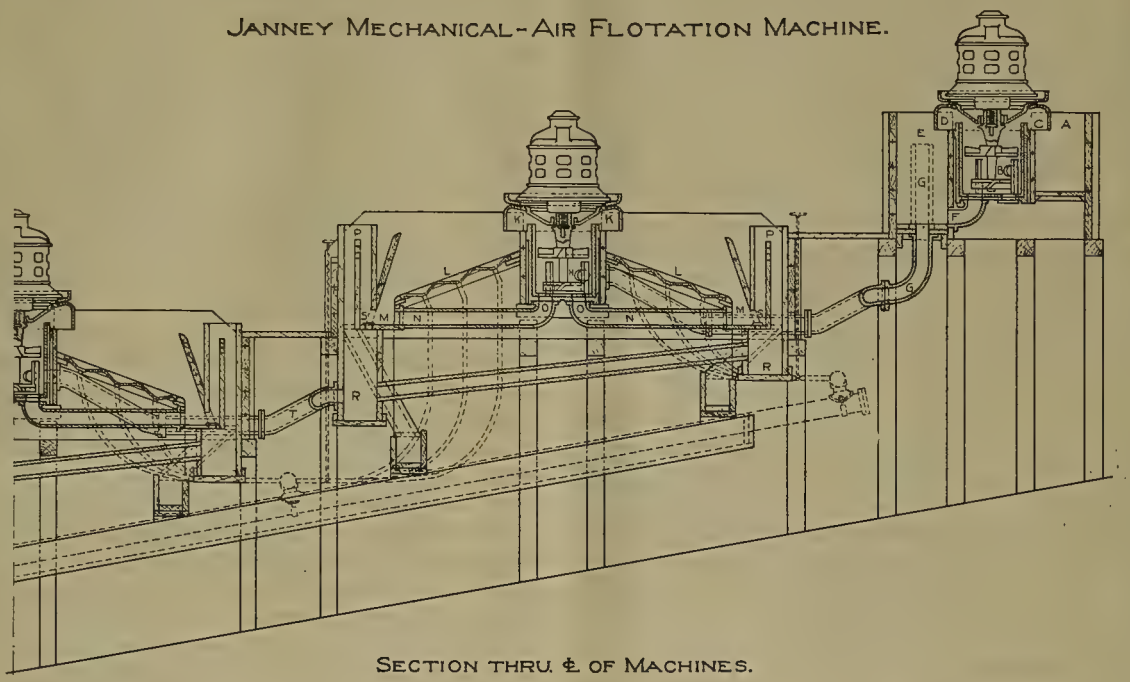
half of the circulation. The excess, equal to the feed, escapes through the pipe *G* into the next machine, which it enters at *H*, where it is ejected, at the points *KK*, into the spitzkasten, passing over the air-mats *LL* to the box at *M*, where part of the pulp passes back through the pipe *N*, joining the original feed of this machine at *OO*, while the excess escapes at *M*, the sand dropping through the spigot *S*, while the slime rises over the weir *P* and falls into the box, where it joins the sand, the joint products passing through *T* into the next machine.

Returning to the flotation of the vanner-concentrate; a sample of the froth when shaken in a pan and patted with the hand, so as to break the bubbles, shows the black copper sulphide that has settled underneath. The



PLAN.

JANNEY MECHANICAL-AIR FLOTATION MACHINE.



SECTION THRU ℄ OF MACHINES.

first six cells produce a concentrate containing 25% copper, 21% iron, and 20% insoluble. The number of cells in use to produce a finished product is regulated by the character of the feed, any cell being made to yield either a middling or a concentrate by shifting the baffle that divides the launder lengthwise into two compartments. The product of the last seven cells is a middling, which is returned for re-treatment.

The oil-mixture consists of mineral, pine, and creosote oils. The feeding of the oil is effected by a special machine of water-wheel type; it is a wheel having small buckets on its periphery dipping into a tank of oil that is kept at a constant level by a constant inflow, the excess returning to a storage-tank, to be returned by a centrifugal pump. The tank to which it returns is equipped with a steam-coil so as to maintain the oil at a uniform consistence. The speed of the feed-wheel is controlled by a friction-disc that regulates the speed as required, maintaining the feed of oil in excess of 10 lb. per ton of ore. A sulphonated alkali, called 'calura', is added to the pulp before it enters the two emulsifiers in order to act, like acid, as an electrolyte; and thereby increase the efficiency of the process, it having been found that the feed requires an alkali instead of an acid. The slimed feed requires an acid; the granular feed an alkali. The amount of vanner-concentrate sent to flotation is 466 tons daily; that of slime is 12,000 tons.

TREATMENT OF SLIME. The slime from the water-concentrating mill runs into ten Dorr thickeners, six of which are 75 by 12 ft. and four 75 by 18 ft. Four more, 75 by 18 ft., are being added. The density of the inflow is 8, and the density of the outflow 24.

From the thickeners the pulp passes to three small equalizing-tanks (8 by 12 ft.). Eventually six equalizers will serve 14 thickeners. The purpose is to correct any fluctuation of feed to the flotation machines, and also to mix the feed with the middling that is returned from the cleaner-cells of the flotation department. Acid is added to the equalizers at the rate of three pounds of 60° B. sulphuric acid per ton of ore.

From the equalizers the pulp is conducted through 12-in. wooden pipes into a 24-in. concrete pipe that ex-

tends the entire width, 583 ft., of the flotation plant. From this conduit the pulp is distributed by 4-in. pipe to each row of cells—each row consisting of one emulsifier and five cells. There are 11 such rows to each unit of the plant, which when complete will consist of 11 units, 8 of them roughers and 2 cleaners, and one a recleaner. Thus there are 726 machines, of which 605 are working-cells and 121 emulsifiers. The emulsifier serves to distribute the oil equally throughout the pulp before it enters the working-cell.

In the roughing-cell a low-grade concentrate is produced and a clean tailing, the concentrate itself being retreated in the 'cleaner', while the tailing goes to waste. The tailing from the cleaner is returned to equalizing-tanks, in which it is mixed with fresh feed. The oil, at the rate of more than 10 lb. per ton of ore, is added by means of a special feeder, which consists of a flat-faced pulley that dips into a small tank of oil and thereby collects a film, to be removed by a scraper impinging on the face of the pulley just above the point where it enters the oil. This feeder is adjustable by the width of the overlap of the scraper. See page opposite.

No skimming device is used in the air-cells. The froth rises sufficiently fast, owing to the large volume of air forced through the porous bottom, to push the mineral-laden froth over the edge of the cell.

The air-machine in use at the time of my visit consisted of five twin-cells, back to back. This entire plant was made of concrete and tile, the latter for piping. Each cell was 9 ft. 4 in. by 4 ft. 3 in. The porous medium was a four-ply canvas stretched crosswise doubly on half-inch centres. Experiments were being made with concrete mats, because the canvas wore out after being in use for eight weeks. Air was admitted at the rate of 150 cubic feet per minute under 4½ lb. pressure. No air-machines are now in use.

The low-grade concentrate from the roughers is returned to two equalizing-tanks, 20 ft. diam. by 30 ft. high, from which it flows into a 24-in. concrete pipe and is distributed to each cleaner-cell through a 4-in. pipe made of concrete and tile. No oil is added to the cleaner, only to the cleaner-tailing before it is returned to the roughing-cell. The mixing of the oil for the mechanical-air machines is done by the emulsifier, the oil being added through valves on a 6-in. header, or pipe, through which runs a steam-pipe, maintaining the oil at a uniform consistence, the oil running from this pipe through ½-in. globe-valves directly to the emulsifier. On account of the large quantity of oil used it is not necessary to employ a mechanical feeder, the volume of oil sufficing to induce a continuous flow that is readily controlled by the valve.

The composition of concentrate and of tailing is as follows:

	%
Concentrate:	
Copper	18
Iron	17
Insoluble	34
Tailing:	
Copper	0.25

From five units the products run into wooden launders; from three units the rougher product and tailing, as well as the cleaner-tailing, drop in a cascade directly into separate concrete launders, the tailing-launder being 6 ft. wide and the concentrate-launder 10 ft. 6 in. wide. These deliver their contents to the return-pumps and main tailing-launders are required. The effect is to produce a small metallurgical Niagara, the function of which is to break the bubbles and produce a product more readily pumped.

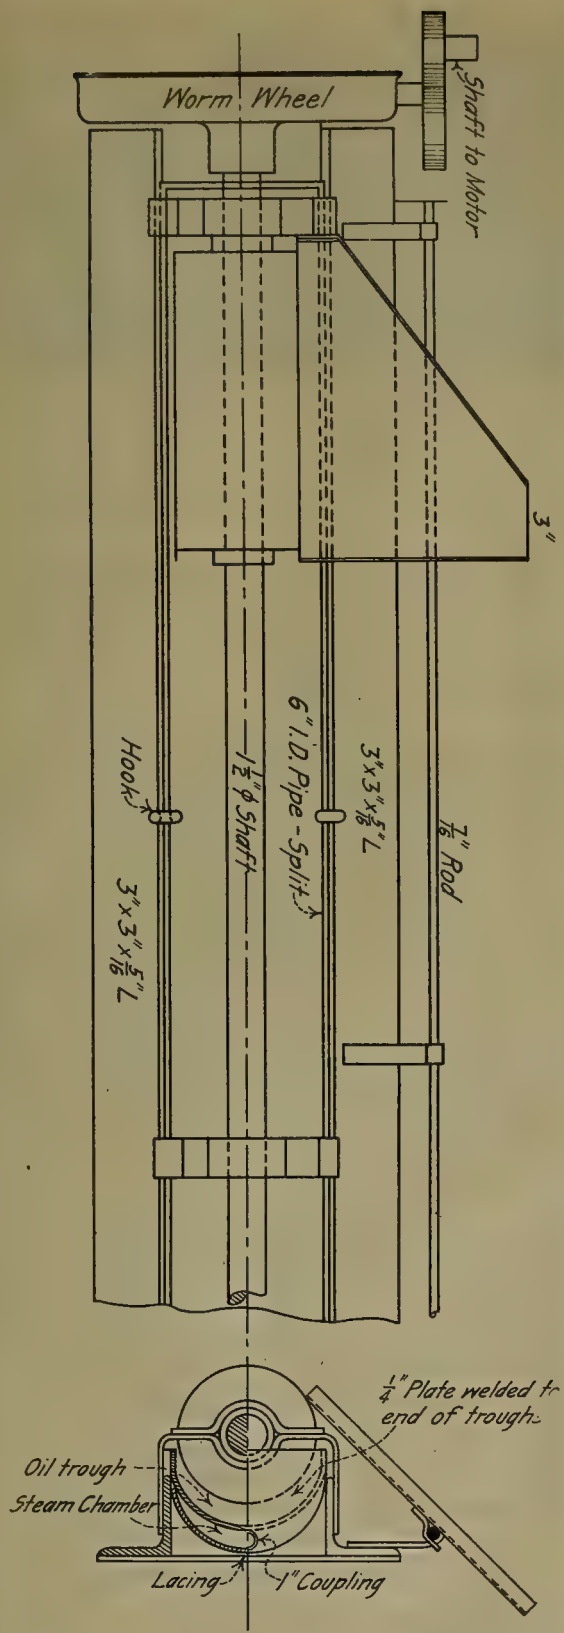
At the far end of the annex, looking down over a series of five double-cells, there is visible a big surface of froth—a veritable boiling sea—the five units occupying a space 100 by 265 feet.

Looking at a series of machines one can note differences in the froth due to causes recognized by the experienced millman. The best type of froth consists of light-gray bubbles, fairly large (two or three inches), of an evanescent character, that is, they burst as soon as they have done their duty of buoying the valuable mineral. A bad froth is lighter in color, the bubbles smaller, and not bursting sufficiently soon. Here I may mention that manipulation is an important factor in flotation. Much of it is empirical rather than scientific, it is not patentable nor is it well adapted to description, therefore the importance of it has not been emphasized either in litigation or in technical literature, but it has played and will continue to play a decisive part in successful flotation.

The two kinds of froth-concentrate are conducted by concrete launders to elevators that discharge into Dorr thickening-tanks, 75 ft. diam. by 20 ft. high, of which seven are in operation and one is being constructed. Here the density is increased from 9 to 51. These tanks are operated in pairs and in series, also intermittently, the idea being to operate a pair until the overflow from the second tank indicates that the suspended solid has accumulated to a level near the discharge, then the feed is diverted to another pair of tanks, until the same stage of repletion is reached. Experience shows that these tanks cannot be used as efficiently in parallel continuously as in series intermittently, because the range of the settling-rate is so great in the froth-concentrate that the colloids accumulate and remain in suspension within the tank.

Filtration. The concentrate produced by water, in the upper mill, flows in concrete launders to four drag-classifiers, which yield two products: (1) the slime, which carries the bulk of the water and flows to a bucket-elevator and is raised to a Dorr thickener (75 ft. diam. by 20 ft. high), the seventh tank of this kind; (2) the coarse portion, which contains about 10% moisture, is discharged upon a belt-conveyor (leading to elevators) that unites this product with the thickened flotation product coming from the other Dorr thickeners. Thus the water-concentrate is mixed with the froth-concentrate before undergoing filtration.

The filter-plant consists of eleven 14 by 14 ft. Portland filters. Another is to be added shortly. Of these 8 to 11



OIL-FEEDING DEVICE

are in constant use. They consist of revolving drums on which a porous medium of canvas is stretched; this is immersed in the concentrate during a part of its revolution, the pulp being drawn to the canvas by the vacuum induced within the drum. The pulp is sucked, and becoming dewatered, is detached by compressed air, which replaces the vacuum. Three Ingersoll-Rand vacuum-pumps of 9900 cu. ft. capacity per minute, serve to operate the filters, which make one revolution every 15 minutes. The vacuum capacity is equal to 1.5 cu. ft. of displacement per square foot of filtering area. The filter-cloth is No. 3 Oakdale canvas. Live steam is injected at the bottom of the hopper in order to heat the pulp and also to agitate it, keeping the coarse particles in suspension. These filters are not equipped with any mechanical device for producing agitation, because experience has shown that no agitation is required other than that caused by the introduction of the steam, as described. The hotter the pulp, the dryer the cake. As the vacuum withdraws the moisture the pulp forms a cake that is loosened by compressed air and removed from the surface of the revolving drum by a scraper that rides on the wires that wrap the filter. The scraper consists of steel plates, which warp and have to be replaced frequently. Experiments are being made with a scraper made in sections, so as to allow closer and more frequent adjustment, and thereby induce a clean removal of the cake.

From the filter the concentrate drops upon a belt-conveyor leading to a short inclined conveyor that discharges directly into a railroad-car. One man, with a hoe, is employed to supervise the loading. Five men are employed in the filter-plant per shift.

(To be Continued)

Costs at the McIntyre Porcupine Mine

Extracting gold ore from a depth of 1000 ft., and treating it in a modern cyanide mill, the McIntyre Porcupine company of Ontario in its last financial year reports costs totaling $5.1466 per ton, as follows:

	Per ton		Per ton
Exploration	$0.0572	Heat, light, water	$0.1437
Developing	0.8492	Head office	0.1725
Extraction	2.3499	General at mine office	0.2131
		Taxes, insurance	0.2199
Total mining	$3.2563	Bullion charges	0.0415
Crushing and ore transport	$0.1487	Total costs	$5.1466
Treatment	0.9039		
Repairs to buildings	0.0470		

Considering the abnormal condition, this total is not high, and is only an increase of 36.33 cents above the previous year. There was 82,089 oz. of fine gold extracted. This cost a total of $918,270, equal to $9.70 per ounce.

ASSAYING 41,409 samples at the Tabowie laboratory of the Oriental Consolidated in Korea, during its last financial year, cost 12.33 cents each.

CONCENTRATE TREATMENT by the Oriental Consolidated in Korea costs $2.16 per ton. The extraction is 83.2%.

An Influenza Story

EXCERPTS FROM LETTERS OF DOUGLAS MUIR, SUPERINTENDENT, TO CHARLES A. CHASE, GENERAL MANAGER.

Baldy, New Mexico,
October 30, 1918.

So far no influenza in this camp, though, as a matter of course, we hardly expect immunity. We have very cold weather and snow—which way this acts on the influenza, I do not know. In fact, there has been little or no sickness in Baldy since the doctor was removed, several months ago.

November 5.

After fooling us into believing that it would pass us by, the influenza—grippe—handed us a broadside between wind and water. The camp is 'hors de combat'. Dr. Bass came out from Cimarron on Sunday and treated 28 families and individuals at that time. He came again today and treated some 12 more cases. The mine lost several shifts cold. The mill has not suffered as yet, and if our one remaining mule-skinner is not afflicted, I believe the mill will suffer no lost time, as in spite of our somewhat reduced mine-crews for the past week we have some five days' ore stored in the chutes.

I guess trying to keep things moving under this trying circumstance got the best of me, for this morning I came down also. The doctor is imperative that I stay in bed until I am fully recovered. All this will explain why I have not been able to answer your several letters received the past week. It will be some little time yet before I can get around to this.

November 12.

The peak-load on influenza has passed Baldy at last. Had some 130 cases and 6 deaths to date. Some four are still in bad condition—Tony Ferganchick among them.

Have a doctor and one nurse in camp—also several untrained helpers. It will be next week at least till we can run, as all of us are so damnably weak and worthless now.

November 13.

I am sorry to tell you that Tony Ferganchick died last night at ten o'clock. His lungs filled up in a final rush after two or three doubtful days. His sister arrived here at 6 p.m. yesterday. This makes total of 8 deaths here to date. A couple of bad cases yet, but the rest of the camp is convalescent. It looks as if it is to be some time before we are the same as formerly. We cripples are mightly weak. Good weather has been much in our favor.

November 15.

This camp was one of the stricken places and it has played hob with mental attitude of nearly all here. I wrote you we had some 130 cases. To date, 11 deaths. Mrs. Damstra died this morning, leaving the three little children. Very sad. Jack Thorn and a couple of others are in danger yet. The whole camp was down. The few left have been digging graves, making coffins, and trying to take care of the sick. No lights in camp for a week because, once the light-engine quit, there were no engineers to start it. Have kept a little heat at hotel and houses with ordinary labor.

The men are leaving as soon as each gets well and able to travel. This condition will greatly affect our ability to get under way when we are able to go to work.

My children so far escaped. My wife came down the third day I was sick and I then had to get up and do the cooking and nursing for a while. Then went back to bed on her improval. We are both up and around the house, but mighty weak. It's one more bit of experience to be added to the store the mining man gradually accumulates. However, our experience has been no different from that of others in the camp and we are fortunate in that our cases were not among the dangerous ones. I trust that your family escapes this sickness or at least has light cases, since you mention that it may have already arrived.

The boarding-house people are discouraged and worn out with what they have been through and I am put to it to hunt up other parties for this work as soon as I can since they are going to leave us. Too bad, as they were a mighty good combination.

MANGANESE EXPORTS from Brazil during the first half of 1918 totaled 174,664 tons, compared with 245,088 tons in 1917, 240,090 tons in 1916, 102,870 tons in 1915, and 85,000 tons in 1914. The reason for the diminished exportation in the current year, as compared with 1917, is largely attributable to the difficulties of transportation over the Central Railway, which carries all of the manganese from the centres of production in the State of Minas Geraes to Rio de Janeiro, the principal port of exportation, according to a U. S. Consular Report from Rio. It is interesting to note the rise of the average price of manganese during the past four years. In 1914 it was 22 milreis per ton; in 1915, 29 milreis; in 1916, 55 milreis; in 1917, 93 milreis; and during the first six months of 1918, 117 milreis per ton (1 milreis = 55c. U. S., but the exchange rate is about 25c. to the milreis).

AIR-TANKS for regulating purposes on pipe-lines have not been considered successful. Their design is a matter of great uncertainty, but, if properly built, air-tanks are of great practical value in improving regulation and preventing water-hammer. Their design is simple and is based on fundamental laws, assording to M. M. Warren in a paper prepared for the American Society of Civil Engineers.

TIN AND TUNGSTEN production of Siam during the past two fiscal years was as under, in tons:

Year	Sn	WO_3
1917	9,466	800
1916	10,078	584

Royalty payable to the Government is 25% on tin and 10% on tungsten.

MINING MANGANESE AT LAS VEGAS, NEVADA

Manganese in the Colorado River Desert Region

The search for manganese ore during the last two years has disclosed some promising deposits in the arid regions in the south-western part of the United States. One area that may be considered a unit extends southward from the Great Bend in the Colorado river near Las Vegas, Nevada. It includes part of Clark county, Nevada; San Bernardino, Riverside, and Imperial counties, California, east of the 115th meridian; and Mohave, Maricopa, Yavapai, and Yuma counties, Arizona, west of a line running southward through Wickenburg. Examinations of the manganese deposits of this area have been made recently by E. L. Jones, Jr., of the U. S. Geological Survey.

Many of these deposits were discovered since the fall of 1917, and some have since become producers. The principal deposits, enumerated from north to south, are near Las Vegas, south-east of Topock; close to Artillery mountains, near Williams river; in Mohave and Yavapai counties; in the Aguila district, Maricopa county; in the Maria and Ironwood mountains, Riverside county; and in the Chocolate mountains, Imperial county. A few promising deposits are found along Colorado river between Needles, California, and Parker, Arizona. Many small deposits that have not yet been worked are widely scattered over the desert.

The northern part of the region is served by the Salt Lake Route; the central part by the main line of the Santa Fe; and a branch line of the same road from Phoenix, Arizona, to Cadiz, California, which crosses Colorado river at Parker; and the southern part by the Southern Pacific and the California Southern, which extends from Blythe Junction, on the Parker cut-off, to Blythe. Although it may seem that this region is reasonably well served by railroads, several large deposits are so difficult of access and so remote from the railroad that the ore from them cannot be marketed profitably. The producing deposits are from a few miles to 45 miles from the railroad. The ore is generally carried to the railroad by auto-trucks, but from one deposit on the Colorado river the ore was taken 43 miles by motor-boat to Parker and there transferred to rail. Desert roads that are continually traveled by motor-trucks must be repaired frequently to facilitate transportation. The ore from some of the deposits must be carried to the road on pack animals.

During the last year the deposits in this region yielded more than 20,000 tons of ore, containing 35 to 47% Mn, 2.5 to 20% silica, with little iron or phosphorus. Mr. Jones estimates that at least 100,000 tons of 40% ore could be produced from the known deposits in this region, but the geologic evidence appears to indicate that no single group contains more than 10,000 tons of high-grade ore, though here and there several deposits that lie within a small area may yield 15,000 tons. Most of the deposits contain from a few hundred to 1000 tons of ore.

The greater part of the ore is shipped to smelters east of the Mississippi, and is used in making ferro-manganese. At the present rate of production it is estimated that 8000 to 10,000 tons of ore containing more than 36% Mn will be produced during the last six months of 1918.

The manganese deposits of this region are of two main types: (1) veins and breccias, and (2) bedded-replacement deposits. Possibly a third type, of sedimentary origin, may occur, but it has not been definitely recognized.

Deposits of the vein and breccia type are by far the most abundant, and they are widely distributed over the whole area explored. The veins are found in rocks ranging in age from the oldest schists and gneisses, which are pre-Cambrian, to the youngest basalts and conglomerates, probably Quaternary. In the Bighorn mountains south of Aguila, Arizona, the manganese-bearing fissures cut both the old schist and granitic rocks and the Tertiary lavas that overlie them. The association of man-

ganese deposits with Tertiary and Quaternary lava flows is striking, and all areas where such rocks occur are promising fields for the manganese prospector. The manganese deposits contained in fissures and brecciated zones were probably formed during the same geologic period—probably the Quaternary. Practically no other metals have been found in the manganese deposits of this type, and they are therefore entirely different from the manganiferous-silver veins found in the Tombstone and Bisbee districts of Arizona.

Deposits of this type were noted in the Las Vegas district; in the Topock, Williams, Aguila, Bouse, and granitic rock and conglomerate fill simple fractures that have well-defined walls.

The manganese oxides of the brecciated zones and fissures are psilomelane, manganite, and pyrolusite. Psilomelane, the hard steel-gray manganese oxide, is found in the outcrops of most of these deposits and appears to have been formed through the alteration of the other oxides. In the Ironwood and Chocolate mountains, psilomelane has been found from the surface to the deepest workings, 70 ft. below, but in most of the deposits in lava-flows it is succeeded below, at shallow depths, by manganite and pyrolusite. Manganite com-

PART OF ARIZONA, CALIFORNIA, AND NEVADA, SHOWING SITUATION OF MANGANESE DEPOSITS

Parker districts; and in the Maria, Ironwood, and Chocolate mountains. Some of these districts, however, may contain also bedded-replacement deposits. The veins and brecciated zones range in width from a few inches to 12 ft., and in length from a few feet to a thousand feet. The ore-shoots within the veins and brecciated zones are from a few feet to 400 ft. long, and extend from 5 to 75 ft. beneath the surface; but their maximum depth in some of the principal deposits has not been determined. The depth to which manganese oxides extend in these deposits appears to be dependent in part on the size and nature of the fissures and the kind of country rock. As the oxides were formed by meteoric waters that circulated in the fractures it seems that narrow fissures or fissures in shear-zones might not be so favorable for deep-seated oxidation as large simple fissures having well-defined walls. The deposits in rhyolite, andesite, and basalt are generally found in brecciated zones which have no well-defined walls, but some veins that cut

monly occurs in stubby crystals in vugs or cavities in the ore, but it also occurs in long fibrous crystals and aggregates, as in the Flynn property north of Bouse. Pyrolusite, the soft black manganese oxide, is generally regarded as an alteration product of manganite.

The manganese oxides in most of these deposits are not associated with iron oxides, but the nodules of psilomelane found in basalt or lavas that are rich in iron-bearing minerals are commonly encased in iron oxide. The most abundant mineral that persistently accompanies the manganese oxides is calcite, but barite occurs in a few deposits. Quartz is apparently absent, although fragments of silicious rock are generally enclosed in the ore. In a number of deposits, at depths ranging from 5 to 50 ft., the manganese oxides are succeeded by a coarsely-crystalline, dark-colored calcite. The dark color is due to minute tree-like forms of manganese oxides. On decomposition this carbonate first yields the soft manganese oxides, which, on further weathering and

7½-ton White truck and trailer hauling empty water-barrels on top of ore on trip to railroad.

chemical action, forms the hard psilomelane found in concentric crusts, some of which, however, contain shells of manganite.

The ore rarely consists of pure oxides of manganese, but is generally a breccia composed of fragments of country rock cemented together and partly replaced by manganese oxides. In order to make a shipping product most of the gangue is removed by hand-sorting or screening, which, however, does not effect a good separation and is wasteful of ore. In the Tolbard and Tres Amigos mines, in the Chocolate mountains, and on the Black Jack, Parsons, Groce, and Bray properties, in the Ironwood mountains, there are ore-shoots several feet wide that require little sorting. The ore shipped from these properties contains 38 to 47% Mn, 2% iron, generally less than 6% silica, and small quantities of phosphorus. Most of the ore shipped from the Aguila district contained 35% Mn, 2% iron, and between 15 and 20% silica. A few carloads contained over 40% Mn. The Hall property, near Parker, is a small producer of ore that contains about 45% Mn. The ore shipped from the Howard property, near the old Pittsburgh Landing, 40 miles north of Parker, on the Colorado river, probably did not contain much over 30% of Mn, because it was not sorted.

Manganese occurs in replacement deposits in the Las Vegas district, south-east of Topock, and in the Williams River district. The largest and best known deposit of this type is that worked by the Manganese Association at Las Vegas. This deposit is contained in beds of clay or tuff, and is cut or bounded by several northward-trending faults. The hills on both sides of the deposit are composed of rhyolite, tuff, and volcanic breccia. The ore-bed lies flat or nearly flat, and ranges in thickness from a few feet to 25 ft. It is underlain by a greenish sand or tuff containing angular fragments of rhyolite. Angular volcanic debris, from a few feet to 15 ft. thick, directly overlies the ore-bed. The ore is a soft brownish-black material, very porous, and of light weight. A 1-ft. cube of ore that weighed 81 lb. when first taken from the pit lost 8 pounds by drying in the air. An analysis of this ore by Smith, Emery & Co., of Los Angeles, gave the following results:

Manganese dioxide (MnO_2)	56.04
Manganese oxide (MnO)	7.08
Silica (SiO_2)	13.73
Alumina (Al_2O_3)	1.85
Iron oxide (Fe_2O_3)	1.68
Lead oxide (PbO)	2.07
Barium oxide (BaO)	0.02
Lime (CaO)	Trace
Magnesia (MgO)	1.41
Copper oxide (CuO)	0.49
Zinc oxide (ZnO)	None
Phosphoric anhydride (P_2O_5)	0.07
Sulphuric anhydride (SO_3)	0.43
Arsenic oxide (As_2O_3)	0.06
Soda (NaO_2) and potash (K_2O)	3.82
Moisture (combined water and carbon dioxide) by difference	11.25
	100.00
Total manganese (Mn)	40.91
Total available oxygen (O)	10.31

Most of the ore in this deposit is homogeneous and will not yield a product of higher grade by sorting or selective mining. The deposit contains, however, in the bedding planes, lenses of white or pink sandy material in places a foot thick, and veins or seams of fibrous gypsum, some of them 2 in. wide, that cut it at steep angles. These materials are readily separable from the ore. On the hillside a short distance east of the main deposit and 60 to 100 ft. above it, there are several openings that expose ore along northward-trending faults. Here the manganese oxides replace tuff and volcanic breccia in varying degrees. In places a breccia composed of fragments of ore and tuff is cut by calcite veinlets. Calcite is abundant in the tuff and volcanic breccia. The ore is in places overlain by a porous mass of gypsum and manganese oxides, which in turn is overlain by angular debris. The manganese oxides were probably introduced along the fault-fissures and replaced the more permeable tuff and the associated sandy clay beds. The manganese oxides are principally pyrolusite.

Other deposits lie along the base of the foothills in the Las Vegas field, extending two miles west and one mile east of the mine of the Manganese Association. None of these has been productive. Most of these deposits are associated with faults or fissures, and are contained in beds of tuff or clay. About two miles west of the mine of

the Manganese Association a drill was driven 77 ft. through beds of gypsum, clay, and tuff in the hope that workable beds of manganese would be encountered, but nothing of value was found.

South-east of Topock, besides the deposits in brecciated zones, there are several deposits of the replacement type, the largest or best developed being one of the Verdun group. The country-rocks are rhyolite, volcanic breccias, and tuff. In the Verdun group, a bed of tuff 5 ft. thick, which is exposed for several hundred feet along its strike, is replaced by manganese oxides. The bed probably contains an average of 22% Mn, 8% iron, and 15% silica. The oxides are principally wad and some pyrolusite.

A number of deposits in the Williams River district, south of the Artillery mountains, are replacements of sandstone beds. Some of these deposits contain large quantities of ore, and attempts are being made to ship from the higher-grade deposits. On the Santa Maria river, eight miles east of its junction with the Big Sandy, manganese oxides occur in beds of clay and sand in the bench-land that borders the valley.

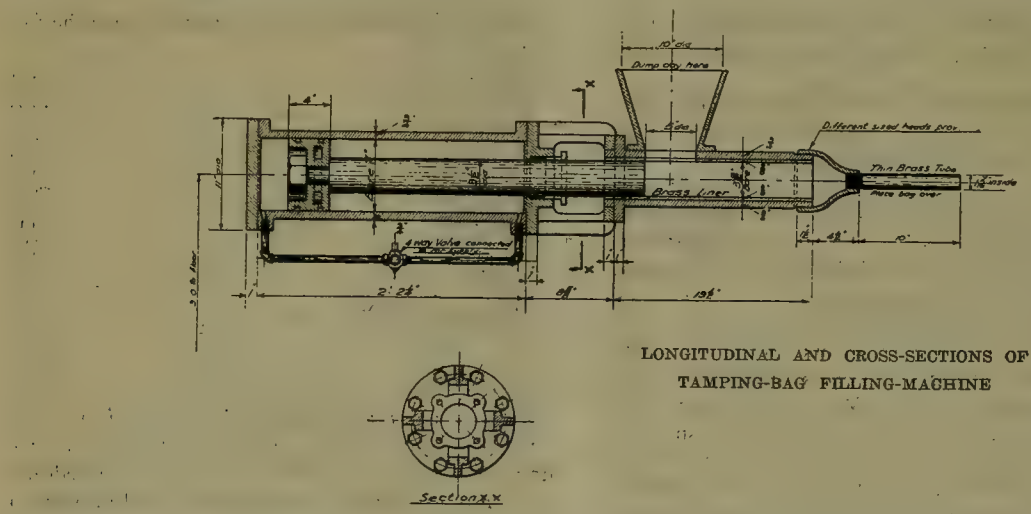
The manganese deposits of western Arizona, southern Nevada, and south-eastern California are mined by open-cuts, shallow shafts, and tunnels. All drilling is done by hand. Water is hauled from the railroad to most of the camps, but several operators have obtained a small supply from wells near the deposits. Labor is scarce, and most of the work is done by Mexicans. Wages are from $3.50 to $4.50 per day. Production has been greatly curtailed during the summer by the intense heat, but it will probably be increased in the fall. The cost of hauling the ore to rail varies considerably; it depends on the quantity of ore, condition of the roads, and length of the haul; but in general is 50c. per ton-mile. The cost of mining is said to range from $6 to $20 per long ton. The freight-rate to Chicago is $11 per long ton, and the rate to most furnaces in Pennsylvania is $15.

Unless the conditions are specially favorable, only high-grade ore can be shipped at a profit, even when prices are abnormally high, as they are now.

Tamping-Bag Filling-Machine

*The accompanying sketch shows a longitudinal section and a cross-section of a machine manufactured by the Granby Consolidated company for filling tamping-bags to be used as stemming in drill-holes before blasting. During the past three years many schemes have been tried to reduce the consumption of explosives. Tamping showed a saving from 10 to 15% in explosives.

The daily consumption of tamping at the Hidden Creek mine at Anyox, B. C., amounts to 400 bags, measuring 1½ by 10 in. each. The filling-machine consists essentially of a cylinder and a piston, which is actuated by compressed air. Clay is fed into a small hopper placed over an opening at the point end of the piston in its the air is let into the back end of the cylinder. This forces the piston ahead and pushes the clay forward through a narrowed aperture to which is fitted a thin brass tube slightly smaller in diameter than the desired cartridge, and about the same length as the paper bags used to make up the cartridges. The paper bags are fitted over the brass tube and the moist clay, which is forced through, fills the bag and at the same time pushes it off the tube. This machine can fill 200 tamping-bags per hour with ease. The material used is a fine blue clay common at Anyox under the glacial drift. Separate front ends can be used with any diameter tubes desired for making up different-size cartridges.



LONGITUDINAL AND CROSS-SECTIONS OF TAMPING-BAG FILLING-MACHINE

THE department of electricity of the French army employs oxy-acetylene welding mostly in connection with cracked frames of gasoline motors used in driving dynamos at and near the front. On account of shell fire it is found impracticable to bring electric current from generating-stations situated well to the rear, and therefore gasoline-motor generating-sets are employed locally. Two men and one set of apparatus take care of all the work necessary for an entire army of 200,000 or more men.

*Abstract from 'Granby News'.

Our Natural Resources of Potash

By FREDERICK W. BROWN

Introduction. Germany's monopoly of the potash trade in time of peace and the abrupt cessation of all shipments with the beginning of hostilities in Europe emphasizes the urgency of immediate development of American sources of one of the most valuable of chemical fertilizers. Within the last 70 years there has been a rapid development in the use of chemicals—nitrogen, phosphorus, and potassium—for inducing increased crop-yields. Before the war there were a hundred companies mining potash in Germany. More than 90% of their enormous product was used for agricultural purposes. German producers of potash are combined in a syndicate under supervision of the Government; the Government fixes the minimum price for which it may be sold and limits the quantity that may be exported. In recent years the United States has taken one-fifth of the entire output of the German mines and one-half of all allowed to be exported. In 1913 this country bought about 1,000,000 tons, nearly all of which was used for fertilizer purposes. In common with the rest of the world, the United States has been dependent upon Germany; to what extent is shown by the fact that in December 1913 muriate of potash sold here for $39 per ton and was quoted at $500 in December 1915, with only small lots available.

Before the development of the German mines in the early 'seventies of the last century potash was derived largely from seaweed and by leaching wood-ashes, and the supply, necessarily limited, was principally consumed in the arts. With the development of the German supply, however, the use of potash as a fertilizer ingredient has increased steadily.

There is no question of the general value of commercial fertilizers in farm practice. The farmer who wisely and systematically applies commercial fertilizer to his fields will raise larger and better crops than his neighbor who, with similar conditions of soil, climate, and rotation, and equal industry applied to cultivation, does not use fertilizers. This statement applies with the same force to the rich soils of the Mississippi Valley as to the soils of the Eastern cotton States or of New England. Moreover, an analysis of the fertilizer investigations carried on by experiment stations in this country and abroad brings out the significant fact that, generally speaking, the use of a complete fertilizer—that is, one containing all three elements—gives larger returns than the use of one containing either one or two of the fertilizer ingredients.

An ample supply of potash has therefore in the last half-century become an agricultural necessity. This is particularly true of certain large sections of this country where the soils are of such a character that profitable crops can be raised only when liberal applications of fertilizing ingredients are added, or where special crops are grown under a system of intensive agriculture. Throughout the cotton States, the tobacco-growing regions, the trucking sections of the Atlantic States, and in citrus-fruit and potato-growing regions the heavy application of commercial fertilizers, including potash, is now a recognized agricultural practice. With these conditions existing, it becomes evident that an adequate and reliable supply of potash has become necessary if American agriculture is to advance to meet the growing needs of increasing population. Up to the stoppage of all shipments the German supply of potash has been adequate, but these mines are not inexhaustible, and a time will come when Germany will see the need of conserving her diminishing supply of this agricultural necessity for the use of her own farmers. When this time comes, either another source must have been found or American agriculture must suffer.

In recent years a number of possible sources of American potash have been brought to public attention. For convenience of treatment here they may be grouped into three classes: trade-wastes, natural deposits, and kelp. There are a number of industries in this country handling materials from which potash may be recovered as a by-product. Until recently little effort has been made to effect such recovery, and large amounts of potash have been allowed to escape into the air or to run off with waste-waters.

Cement Manufacture. One of the more important sources of potash from such trade-wastes occurs in connection with the cement industry. Throughout the country exist deposits of feldspar and other silicates containing potash. This potash, however, is in an insoluble form, and the containing rock must undergo treatment before the potash is liberated in a form to be taken up by the soil-water and used by plants.

It seems unlikely that any process will be developed which will make it commercially profitable to treat the rock for the potash alone and discard the residue. The Bureau of Soils pointed out, however, some years ago, that the potash-containing silicates might be used in the cement industry and the potash saved as a by-product. It has been demonstrated in recent years that this procedure is entirely practicable through the installation of electrical precipitators in the flues of cement mills. One company has had this installation in operation for several years, and several other large mills are installing apparatus for the same purpose. In this process the combined insoluble potash contained in the clay used in cement manufacture is released and rendered soluble under the

*This article is by the Assistant in Charge of Investigation of Fertilizer Resources, Bureau of Soils.

high temperature of the kiln and passes off with the dust in the stack, where it is caught and thrown down by electric precipitators. A large proportion of the potash contained in the raw mix is recovered in this way; and while the initial installation of the precipitators is somewhat expensive, the cost of operation is small. If, therefore, the raw mix going into the kilns contains a sufficient percentage of potash, the process, even under normal conditions of the market, will pay an excellent return on the investment.

It may be of interest to state that the process was perfected with the object of abating the nuisance caused by the escape of fume and dust from a cement mill and the consequent injury to citrus groves at Riverside, California. Mills so situated that the fume and dust from their stacks constitute a nuisance to surrounding property may find it advisable to install the apparatus, even though the returns from the potash collected would not of themselves justify the expenditure.

Since 85,914,907 bbl. of cement were produced in this country in 1915, this appears at present a promising source of a domestic supply.

Blast-Furnaces. Similarly there is the possibility of a large supply of potash as a by-product of blast-furnace operations. Blast-furnace gas contains varying percentages of potash. In ordinary practice this gas is cleaned by passing it through dust-catchers and washers and is then available for use in the stoves for heating the air used in the blast and under steam-boilers. Recent practice has found a further use for the gas in operating gas-engines, but for this purpose it must be further cleaned by passing it through secondary washers.

At present a small proportion of the potash that escapes from blast-furnaces is collected in the stoves and boilers, but the greater part is lost in the wash-waters or escapes from the flues. Moreover, the presence of potash fume remaining in the gas as it comes from the primary washers is probably responsible for the condition so troublesome to furnace operators known as 'smoky gas.' An experiment recently conducted by one of the largest steel-mills of the country has shown that this necessary operation of cleaning the gas can be accomplished more satisfactorily and probably more economically by means of electrical precipitation than by the methods now used. In addition to furnishing a more effective cleaning of the gas, such an installation would recover practically all the potash. This appears to be an important potential source of potash, as the aggregate amount now volatilized and lost in the blast-furnaces of the country is very large.

Wool-Wastes. Among the impurities contained in wool as it comes from the sheep, and requiring to be removed before the wool can be used by the spinner, is a material called 'suint'. This really is the dried sweat of the sheep. It is soluble in water, and consists principally of potash salts. In addition to suint, crude wool also contains grease, and any process for recovering potash from wool must include the recovery of the grease also to be commercially profitable. Wool-grease is used for dressing leather and for lubricating purposes, and is also the source of the valuable lanolin compounds used in pharmaceutical preparations. Probably the best method of wool scouring is called the 'solvent' process, and recovers the grease and suint separately. The wool is treated with a volatile solvent (gasoline, naphtha, or carbon disulphide) which removes the grease, and is then washed in warm water to extract the suint. The solution of wool-grease then is distilled, in which operation the solvent passes off and is recovered for further use, and the grease is left as a residue. The solution of suint is evaporated and calcined for its potash.

In 1914 about 290,000,000 lb. of raw wool was produced in this country, and about 220,000,000 lb. was imported. The potash content will average about 4½% of the weight of the crude wool, so that approximately 11,500 tons of potash might have been recovered from the wool scoured in the United States in that year.

Wood-Wastes. The wood-using industries of the country produce a large amount of saw-dust annually, and much of this is used as fuel in the furnaces of the plants. It is probable that much of the wood-ash so produced is now used for fertilizer purposes and to this extent serves as a source of potash. So much as is not so used should be, or should be leached for the recovery of potash salts. Wood-ashes vary widely in their potash content, this variation being dependent on the species and on the part of the tree from which the wood is taken. It is impracticable, therefore, to estimate the amount of potash that might be derived from this source, but it would come to several thousand tons.

Many farmers use wood for fuel, and anyone so situated has at hand a source of potash that should be carefully saved. While the amount so secured by an individual necessarily will be small, in the aggregate a considerable saving would result. If home mixing of fertilizers is practised, wood-ash should not be mixed with other ingredients, but should be applied to the soil separately, as the lime in the ash has a tendency to liberate the nitrogen in certain other fertilizer constituents if mixed with them.

Natural Deposits. So far the extensive investigations of the Bureau of Soils and the Geological Survey have not disclosed any deposits of potash salts in this country comparable in extent or commercial importance with the German deposits. Such sources of potash salts as have come to light are confined to the desert basins of the West and are small in extent. While some of these may become of local importance, the total potash that can reasonably be expected from them is too small to be of importance beyond a limited area contiguous to the mines. It is, however, always possible that borings put down for water, oil, gas, or for any purpose, may disclose the existence of such salts. This is true particularly in regions where rock-salt deposits are known to exist. It is highly desirable, therefore, that persons engaged in boring operations have this possibility always in mind and carefully examine all material brought up by the drill. The Bureau of Soils of the Department of Agriculture will analyze, free of charge, any samples of this kind.

In western Nebraska there are a number of small lakes or ponds whose waters contain considerable quantities of potassium carbonate. These lakes are now being worked, and carbonate of potash containing about 28% K_2O is being marketed. The public statement was recently made by the American representative of the German syndicate that these Nebraskan lakes were furnishing about half the potash now being produced in the country. In working these lakes, brine is pumped to the mill, where it is evaporated down to wet salts in vacuum-pans. These wet salts are then passed through rotary driers, and are ready for shipment. While the size of these lakes precludes the possibility of their ever furnishing a large supply of potash, it is to be hoped that the operators will succeed in perfecting their processes so as to be able to continue production upon a return to normal conditions.

Alunite. In the south-central part of Utah, near Marysvale, there is a large deposit of the mineral alunite, an aluminum-potassium sulphate, from which potassium sulphate and alumina may be extracted after roasting at moderate temperatures. The technical difficulties of extraction are not serious, and in time alunite should become a valuable source of potash for the country. That the mines can be worked commercially for the potash alone is doubtful, however. The deposits occur in mountainous country, necessitating the construction of expensive tramways to bring the ore to the mill, and, once extracted, the potash salts must be carried East by rail, entailing heavy freight-cost. Therefore a market must be found for the alumina as well as the potash.

Under the abnormal conditions brought about by the European war two companies have entered this field, and sulphate of potash from alunite actually has been shipped. It is doubtful if these companies could continue operating on their present systems under normal conditions and with potash selling at the figures quoted before the War. That many millions of tons of potash may be derived from this source, however, when the problems now confronting the operators have been solved, seems reasonably certain.

Searles Lake. A brine deposit in the Desert Basin area probably will prove of some importance as a commercial source of potash. This is the so-called Searles Lake, in California, a body of mud and crystalline salt, some 12 square miles in area and of undetermined depth. Beneath the surface are saline muds and sands saturated with brine which contains 7% of potash in the total solids. Recently it was announced that the persons claiming title to the property would proceed at once to exploit it commercially. So far, however, potash from this source has not been produced in any quantity. That Searles Lake brine ultimately will prove a valuable source of soluble potash seems highly probable. It has been estimated that it will furnish at least 4,000,000 tons of potassium chloride, and probably considerably more.

The waters of Great Salt Lake and other natural brine bodies contain potash in small proportions. No method has been devised by which the potash may be recovered at a price which will permit competition with German salts. It is possible that such a method may be discovered, however, in which event a source of potash will be opened large enough to supply this country's needs for many years.

Kelp. Along the Pacific Coast of North America, from Magdalena bay, in Lower California, to the Shumagin islands of the Alaskan peninsula, are found beds of giant kelp of several species. These huge sea plants, sometimes growing to a length of 100 ft., contain a surprising amount of potash salts. Dried kelp of the most important species will run from 25 to 30% of potassium chloride. At present these Pacific kelps appear to be one of the most hopeful sources of an adequate supply of potash for the country's needs. The realization of this hope is, however, like most new enterprises, beset with difficulties.

The beds are close to the shore, almost all of them being, in fact, within the three-mile limit. The kelp is harvested by cutting the upright stem from three to six feet below the surface, which secures not only that portion but also the much larger portion which floats on the surface of the water. The wet kelp contains from 85 to 93% of water. This must be removed. The plants are non-fibrous and of a gummy gelatinous nature, making it difficult, if not impossible, to extract the water by pressure.

Several methods have been suggested for treating these kelps on a commercial scale with a view to their utilization for fertilizer purposes. The simplest is to dry and grind the material and market this ground product for direct application to the soil or for mixing in commercial fertilizers. The drying can be accomplished in rotary driers such as are used for treating garbage and fish refuse, and the dried ground kelp contains 25% potassium chloride, 2% nitrogen, and organic matter of value for improving the physical condition of many soils by the formation of humus. In addition, it possesses excellent mechanical properties for fertilizer-mixing purposes.

If the kelp grew on the Eastern seaboard, close to the regions of large fertilizer demand, this method of treatment probably would be the most economical and satisfactory. Unfortunately, however, the kelp occurs on one side of the country and fertilizers are most extensively used on the other; and while the dried ground kelp will have the benefit of water-rates of transportation via the Panama Canal, about three-fourths of the material so transported consists of practically valueless matter, and the freight-charges probably would prove too heavy an item to permit this method of utilization in the face of competition with German importations. Investigations are now being made in the hope of transplanting the Pacific kelps to the Atlantic coast. If this should be accomplished and the plants established in extensive beds, this dried ground kelp undoubtedly would become an important factor in the fertilizer business.

Another process now being used is to burn the dried kelp and market the ash for its potash content. By this process the valuable nitrogen content is volatilized and

lost, and a small part of the potash content is similarly destroyed. The heat produced in the combustion is also wasted. In addition, freight-charges must be paid on worthless ash, and it is admitted by the companies now using the process that unless further economies are introduced the costs are too great for successful operation under normal conditions.

The process that seems most likely to succeed in commercial practice is to distill the dried kelp in retorts constructed on the general principal of the by-product coke-oven. This results in a charred residue, containing all the potash salts, which may then be recovered by leaching and evaporation. In the process of distillation the nitrogen in the kelp is driven off and recovered in the form of ammonia; combustible gas is evolved in considerable quantities and is available for use as fuel in the retorts and under the evaporating vats, and charcoal and tarry products are recovered, which may be sold or used as fuel. Iodine and some other by-products also may be recovered.

It is probable that some such method of extraction which will conserve and use the heat units evolved in the reaction and save the by-products will prove necessary in the end to make the recovery of potash from kelp a profitable industry under normal conditions. Since the beginning of the War and the stoppage of German potash shipments several large and responsible companies have erected plants on the southern California coast for the treatment of kelp. These companies are producing either dried kelp, which at present prices for potash can be shipped East at a profit despite the long freight-haul, or kelp-ash, which results from burning the dried kelp. One of the companies is using a fermentation process and producing acetone for munition purposes, as well as high-grade potash salts.

However, with the development and demonstration of an economical method of extraction, an American potash industry should grow up on the Pacific coast able to furnish from these giant kelps a supply of high-grade potash salts adequate for all our needs. The Bureau of Soils is at present erecting an experimental plant at Summerland, California, to determine the best methods of extraction. Since most of the beds lie within the three-mile limit, State legislation by California, Oregon, and Washington, and Federal legislation as regards Alaska, is needed to provide protection against reckless and indiscriminate cutting and to furnish leasing regulations under which the private investor who desires to erect a plant for treating kelp may be assured of a supply of raw material free from encroachment by competitors. Efforts are now being made to secure action of this kind by the legislatures of the States interested and by the Federal Congress.

IN LOADING HOLES the primer and powder should be carefully pressed into the hole, but the primer should not be tamped with hard strokes. It is not necessary to use great force in loading, so long as the powder is pressed sufficiently tight to prevent it from falling out.

Nine Months Mining in Ontario

Returns received by the Ontario Bureau of Mines for the nine months ended September 30 are summarized below, compared with the corresponding period of 1917:

	Quantity		Value	
Product	1917	1918	1917	1918
Gold, oz.	.....	.....	$6,754,535	$6,875,766
Silver, oz.	15,236,002	13,145,596	12,001,875	12,500,980
Cobalt, metal, lb.	295,866	317,291	433,739	702,717
Copper, metal, lb.	.....	359,713	.....	79,137
Nickel, metal, lb.	166,921	582,992	67,499	.....
Nickel oxide, lb.	10,831	5,592	3,025	1,731
Cobalt oxide, lb.	276,769	397,728	323,162	572,845
Other cobalt and nickel compounds, lb.	276,217	367,923	30,025	53,784
Molybdenite, lb.	65,827	43,631	83,550	54,671
Lead, lb.	1,080,000	1,291,571	139,948	115,117
Nickel matte, tons	31,064	33,508	15,532,000	20,105,087
Copper matte, tons	15,928	17,052	6,371,200	6,820,785
Copper ore, tons	2,658	16	33,419	318
Iron ore, tons	138,808	154,243	559,099	697,839
Pig-iron, tons	513,232	541,564	9,841,438	14,728,461

GOLD: Production has been well maintained, considering adverse conditions, which have been aggravated rather than improved during 1918. The output—$6,875,766—was produced from 711,185 tons of ore. Hollinger and McIntyre continue to be the largest producers, the output respectively being $4,685,586 and $1,206,875. New producers this year include Davidson at Porcupine, Patricia at Boston Creek, and Lake Shore at Kirkland Lake.

SILVER: Despite a decline in quantity, the output of silver for the period, if maintained for the remainder of the year, will probably equal in value that of any other year. Mines shipping 750,000 oz. or over are given in order: Nipissing, Mining Corporation, Kerr Lake, and O'Brien. Shippers this year include mines that have been idle for some time. Some of these are the Green Meehan at North Cobalt, Silver Eagle and Keeley mines at South Lorrain, and Peterson Lake. Many of the mines are now treating slime and tailing dumps by flotation methods.

REFINERIES: The southern Ontario refineries treated 2758 tons of ore, 1208 tons of concentrate, and 1847 tons of residue, extracting 3,655,975 oz. of silver, in addition to cobalt and nickel in the form of metal, oxides, and other compounds. About one-third of the output of cobalt metal by the Deloro Smelting & Refining Co. was used in the production of 'stellite'. Nickel metal from silver-cobalt-nickel ores was marketed to the extent of 224,787 lb., worth $89,275.

NICKEL-COPPER: The only copper-ore shipment was a trial lot by the Hudson Copper Co. of Havilah. High operating costs, increased freight-rates and smelter charges, and lack of a custom smelter within the Province contribute to make copper mining unprofitable at the present time.

The new Port Colborne refinery of the International Nickel Co., which started last July, up to the end of September had produced 358,205 lb. of nickel and 359,713 lb. of copper. The Copper Cliff and Coniston smelters treated 1,141,089 tons of ore, producing therefrom 64,926 tons of matte containing 33,688 tons of nickel and 17,232 tons of copper.

Topography and Geology of Dredging Areas—I

By CHARLES JANIN

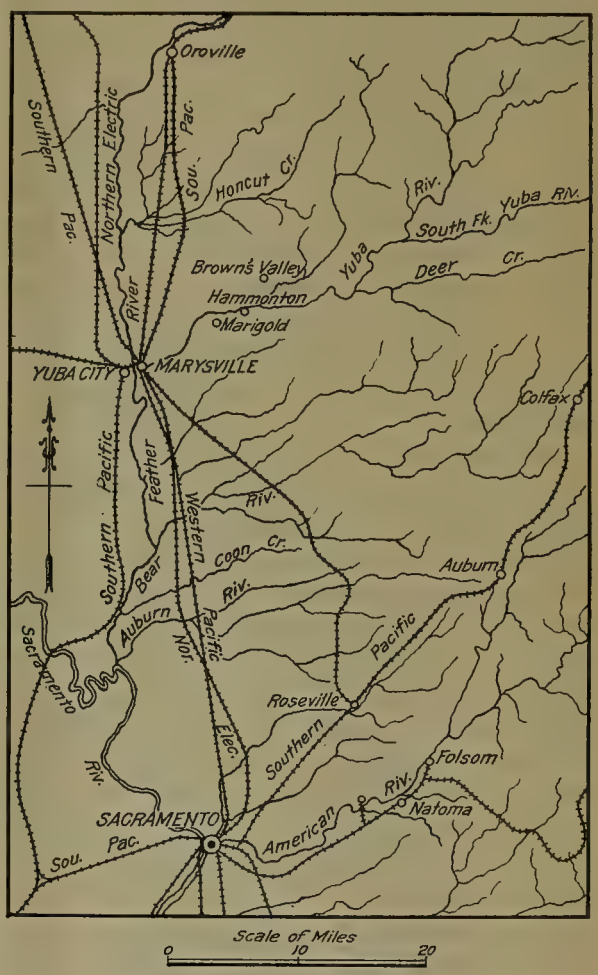
CALIFORNIA. Undoubtedly the placers derive their gold from eroded vein and other deposits in the bedrock. One should remember that a good placer should contain fairly coarse gold, because fine gold does not concentrate as readily and is borne away with the sand. Quartz veins that carry mainly coarse gold are apt to be 'spotty' and uncertain. In the really valuable quartz lodes the gold mainly is fine, either free or in pyrite, and the erosion of such lodes does not result in rich placers. For this reason there is not likely to be any close association between the best quartz-mining districts and the most productive placers. The American and Feather rivers in Placer and Plumas counties have furnished rich placers but are notably poor in quartz mines. The Caribou district of British Columbia and the Klondike have similar characteristics. The Mother Lode region of California has yielded very little placer gold. The Columbia placer district of Tuolumne county, though limited, was one of the richest in California. It adjoins a district that has pockety quartz mines that produced considerable coarse gold—notably the Bonanza mine, which was profitable at times—but has shown no lodes that would maintain profitable mining on an extensive scale.

All the gold of the valley placers is fine as compared with the coarse gold found along the higher courses of the present rivers. Although the finest particles have undoubtedly been carried some distance, the coarse gold has probably not traveled far from where it first lodged. Most of the gold is in fine flat scales that are comparatively easy to recover; but some is as an almost impalpable powder and is carried off in suspension and some is associated with sulphides, or is coated with iron or other oxides, and is lost through failure to amalgamate. Occasionally fair-sized nuggets are found in the dredge-sluices at Breckenridge, Colorado. At the Alta Bert property, in Trinity county, a large part of the gold is relatively coarse.

The principal dredging districts in California are at Oroville on the Feather river; at Daguerre Point, about 12 miles above Marysville, on the Yuba; and at Folsom, on the American river. A smaller district has been worked for some time near Chico in Butte county, and some years ago dredging was tried about Wheatland on the Bear river, but the gravel proved to be poor.

Smaller quantities of gold are dredged in Siskiyou, Trinity, and Shasta counties. Dredges are also busy in Calaveras county, Merced county, and Stanislaus county, and some dredging is being done on the American river above Auburn.

The depth of the gravel ranges from 15 to 18 ft. In part the gravels are coarse, cobbles up to a foot in diameter being by no means uncommon. In Trinity county many of the boulders weigh more than a ton. The gravel contains much sand and clay in places and



PART OF CALIFORNIA, SHOWING PRINCIPAL DREDGING AREAS

is ill sorted. The Oroville gravel almost universally rests on a false bedrock of volcanic tuff or hardpan; some of it lies below the present river-level, and others rest on benches up to 100 ft. above the channels of today. The tuff forms a sheet 12 to 60 ft. thick. At Oroville, and along the Yuba river, there is auriferous gravel below it, but under present conditions this lower gravel cannot be worked.

While the greater proportion of the gold is in contact with or directly above bedrock, gold is by no means

everywhere confined to the lower layers. Gold is often distributed through the gravel or contained in one or more upper beds. Where occasional seams of clay or other material form an impervious layer in otherwise porous gravel, the downward movement of heavy minerals is arrested, and above these layers pay-streaks are formed, a cross-section of a deposit sometimes showing several of them. Where the material is clayey, the gold is likely to be distributed throughout it. As the distance from the mouth of a canyon increases the gold becomes finer and the gravels poorer.*

The Oroville dredging ground, now practically exhausted, comprised about 7000 acres of the plain of Feather river, beginning at the town and continuing to about five miles below, where the ground gradually became poorer. The width varied from less than a mile to about two miles. The average depth of gravel is about 30 ft., increasing to 40 ft. farther down the river. The gravel rests on a false bedrock consisting of a compact tuff containing no large lava pebbles or fragments.

The Feather river, along which the placers lie, flows through a broad valley whose surface is covered with gold-bearing gravels and sands of varying richness and depth. The gold originally came from the gold-bearing quartz veins and old gold-bearing gravels in the mountainous region of the river's upper course, and has been re-deposited with the gravels and sands in the neighborhood of Oroville.

As a whole the placer ground is chiefly heavy gravel, with a top layer of sand or sandy loam. This loam is underlain by a stratum of mixed gravel and sand, and in places by well-defined strata of sand, below which are other strata of coarse or fine gravel and sand, the size of the rock fragments varying from that of a pea to occasional boulders 18 inches in diameter. This mixture of gravel and sand is 20 to 30 ft., and in places 40 ft., thick. Beneath it lies the false bedrock, a tuff or volcanic ash, fairly smooth and regular in contour, and soft enough to dig with the dredge-buckets. In places the placers contain cemented gravel, and in places considerable clay makes washing difficult. Most of the gold is in coarse gravel; here and there some is contained in sand. The gold is fine, and some of it may be called flour-gold. The gold content of the gravel worked ranges from 8 to 35 cents per cubic yard.

The fineness of grain of the gold in the Oroville district is given in the following statement, which represents averages from a number of tests made by screening:

Mesh of screen	%
60 and coarser	58.1
60 to 100	15.3
100 to 120	2.9
120 to 150	2.4
150 and finer	21.1

In the other districts the gold has approximately the same size of grain. Occasionally, as in Trinity and Siskiyou counties, small nuggets having a value of 50 cents to several dollars are found, but in California such nuggets are confined almost entirely to the gravels in those counties. The gold is generally of high grade, its fineness averaging 915 to 930.

The Yuba field, 12 miles from Marysville, at Daguerre Point, is situated where the first greenstone hills of Yuba county emerge from the Quaternary covering on the south side of the river. The available dredging land on Yuba river has a total area of about 6000 acres; it extends along the river for a distance of about seven miles and has a width of nearly two miles.

The ground lies only a little above river-level and is covered to a depth of 40 ft. with the old tailing the river has brought from the hydraulic mines in the mountains. Before this tailing was deposited the low bars rose to a height of 15 to 20 ft. above normal water-level. Above Daguerre Point, on the north side of the river, the gravel rests on the greenstone bedrock, but elsewhere in the area they lie on a stratum of hardpan or compact clay, which on the north side of the river rises to form low rolling hills. Below the clay in places is volcanic tuff, similar to that of Oroville, and probably derived from the same source, namely, the volcano of the Marysville Buttes. The bedrock brought up by the dredges does not usually show the presence of volcanic material.

The Folsom dredging area at the mouth of the canyon of the American river is the largest in the State, comprising about 13,000 acres. From Folsom, in Sacramento county, the district extends mainly along the south side of the river for about seven miles, with a width of one to two miles, forming a wide belt of dredging ground of sandy gravel 20 to 35 ft. deep. In places clay is encountered, but the conditions at Sacramento and Mississippi and on the Kendall and Nuttall tracts are generally satisfactory for dredging. Like the gravel of the bars, this gravel rests on a false bedrock of white volcanic ash, which outcrops in the Orangevale bluff, north of the river, and at other points on higher ground south of the river. Only at two places along Willow creek, within the area actually exploited, does the real bedrock (granite and slate) appear under the gravel.

Farther south and south-west of Folsom is a higher belt of terrace gravel on which the early miners did much shallow hydraulic and drift mining. This belt appears to represent an older channel, which started at Mormon island and Blue Wing ravine and continued along the upper course of Willow creek. Here the channel is 400 ft. wide, and formely was worked at several places through shafts 60 to 80 ft. deep. At Rebel Hill this gravel spreads out considerably and is 50 to 70 ft. deep, the volcanic ash bedrock lying 50 ft. above the river. In this area the formation consists of gravel held tightly together with clay. In places the gravel is cemented and is covered with a fine clayey soil, and for years profitable dredging was thought to be impossible there. The conditions for work are unfavorable, as the digging is hard, and the clay makes washing difficult. There are two principal pay-streaks; one is 34 ft. below the surface, the second, at 50 ft. or more, rests on the false bedrock.

*For a discussion of the California placers, see Lindgren, Waldemar, 'The Tertiary Gravels of the Sierra Nevada of California': U. S. Geol. Survey Prof. Paper 73, 1911, 220 pp.

ALASKA

Volney Richmond, superintendent of the Northern Commercial Co., recently at Dawson, Yukon, en route to San Francisco, after having toured the lower Yukon camps for several weeks, gives the following estimate of the gold yield for the present season, based upon figures kept by reliable authorities in the region:

Iditarod	$1,500,000
Fairbanks	1,000,000
Tolovana	900,000
Ruby	250,000
Marshall	200,000
Hot Springs	150,000
Koyukuk	140,000
Circle	100,000
Rampart	30,000
Total	$4,270,000

MAP OF ALASKA, SHOWING SITUATION OF THE DISTRICTS ENUMERATED BELOW

The principal mining districts are indicated in the numbered circles, as follows: (1) Port Dick; (2) Sunrise; (3) Resurrection; (4) Falls Creek; (5) Latouche; (6) Bering River coal; (7) Valdez; (8) Illiamma; (9) Bonanza; (10) Matanuska coal; (11) Willow Creek; (12) Yentna; (13) and (14) Placers; (15) Broad Pass; (16) Nenana coal; (17) Kantishna; (18) Hot Springs; (19) Fairbanks; (20) Circle; (21) Rampart; (22) Chandlar; (23) Eagle; (24) Koyukuk; (25) Kuskokwim; (26) Ruby; (27) Ophir; (28) Iditarod; (29) Georgetown; (30) Nulato coal; (31), (32), and (33) Seward Peninsula.—Map from 'All Alaska Review' of Seward.

Mr. Richmond estimated that these figures are only 50% of normal. The figures were gathered from interior operators, bankers, and others in close touch. The falling-off is due largely to men being called away to war and to the fact that the ground is low grade and will not pay to work during the period of high costs.

He estimated that the Tanana valley this winter will have 3500 people; Iditarod, 400; Ruby, 250; Koyukuk, 150; and Marshall, 100. Possibly there will be 1000 persons on the Seward peninsula, including Nome. All these figures are probably 50% below normal. Nome was hard hit early in the season by reason of the fact that the 40 dredges of that country shut-down at the beginning of the season. It seems that the employees there went on strike for more wages and shorter hours at the opening of the season, and the operators, knowing that they could not pay more wages when costs of food and material were so high and gold lost its purchasing power, refused to grant the increase. They simply shut-down and remained so all season. At Nenana about 700 men are at work for the Government railway, and 700 more people are in the town and vicinity. The railway is extended out 40 miles from the town and construction is continuing under direction of Mr. Brown, who seems to be making a good record. Work is also under way on the Fairbanks-Nenana section. One of the best producing properties in the Iditarod this year was that owned by Perry Ford and Al Walsh and worked on a 'lay' by Walsh and Tom Aitken. It produced $84,000. The property is on a high hill.

The Mines Report—covering gold silver, copper, and lead in Alaska in 1917—by G. C. Martin, has just been issued by the U. S. Geological Survey. Final figures were $14,657,353 of gold, 1,239,150 oz. of silver, 88,793,400 lb. of copper, and 852 tons of lead, all, save lead, considerable decreases. Lode mines contributed 28.5% of the total gold. Fairbanks district placer operations recovered 63,371 oz. of gold, compared with 87,075 oz. in 1916, and 466,819 oz. in 1909. Lode mining there reported 1200 oz., against 12,237 oz. in 1913. Seward Peninsula placers saved $2,600,000, a decrease of $350,000 when compared with 1916.

Juneau.—Alaska Gold Mines during the third quarter of 1918 operated at a loss of $11,984. For 9 months the deficit is $34,250; in 1917 this period showed a profit of $236,011.

Kennecott.—The Mother Lode Copper Mining Co. has had an injunction granted against it by the Supreme Court at Seattle, preventing the company from completing sale of its property to the Mother Lode Coalition Mines Co. (organized by the Kennecott Copper Corporation). A minority shareholder brought up the action. The Court held that there was a defect in the notice sent out by the Mother Lode to shareholders, notifying them of a special meeting to be held on July 1, last, for the purpose of ratifying sale of the mine to the Coalition company.

ARIZONA

Bisbee.—Calumet & Arizona pays $2 per share on December 23. This makes $8 for 1918, against $11 in 1917, $9 in 1916, and $3.25 in 1915.

The Wolverine mine is shipping a carload of ore daily.

At the Boras lease, 8% copper ore has been cut on the 200-ft. level.

Ground south and west of the White Tail Deer property of the Copper Queen is being opened by a local syndicate.

The mine warehouse of the Copper Queen was burned recently, handicapping operations considerably.

Humboldt.—Consolidated Arizona Smelting pays a dividend of 1%, equal to $83,150, on December 17.

Jerome.—United Verde Extension produced 4,702,500 lb. of copper in October, slightly less than in September.

CALIFORNIA

Oil production of the State in October amounted to 282,433 bbl. daily, an increase of 6276 bbl. over the September output. There were 61 new rigs, 359 wells drilling, 50 completed, 6 abandoned, and 8448 producing. The 50 new wells are yielding 13,297 bbl. daily. Stocks in fields and pipe-lines totaled 36,562,897 bbl. on October 1 and 37,400,859 bbl. on November 1.

Redding.—The Mammoth Copper Co. has made a final payment of $32,000 on the $40,000 purchase price for the Keystone group of nine copper claims lying between the Balaklala and Stowell mines, all near the Mammoth. The owners of the Keystone were William Slemmer, Dr. George A. Grotefend, and Robert Stevenson. The Mammoth took an option a year ago. Since then diamond-drills have revealed the extent of the orebodies, and shipments of ore have been made to the company's smelter at Kennett.

Shawmut.—Owing to shortage of labor the Eagle-Shawmut gold mine has been closed until the situation improves. Unless the mill treats 400 tons daily the company finds it uneconomical to work.

COLORADO

Alta.—The Belmont Wagner company lost 67 men through influenza, and is generally short of men. The economic milling capacity is 300 tons daily, so until conditions improve the management is considering the expediency of continuing operations.

Breckenridge.—Owing to abnormal conditions—war and influenza—the Wellington Mines Co. has only 85 men at work, against a normal force of 125. The mill is making high-grade zinc and lead concentrate. R. H. Henderson is in charge.

Cripple Creek.—Cresson Consolidated pays 10c. per share, equal to $122,000, on December 10. This distribution is "from funds received from the sale of ore-reserves acquired prior to March 1, 1913." The total to date is $7,149,163.

Influenza is still handicapping operations in this district, and few mines are working to capacity.

An important discovery for the Ironclad Hill area has been made by S. A. Denman, lessee, and former superintendent for the Cripple Creek Deep Leasing Co., at a depth of 950 ft. in the mine of the Jerry Johnson Gold Mining Co. An ore-shoot has been opened so far a distance of 20 ft. Samples return from $30 to $140 per ton. The first car shipped, with little sorting, returned $30 per ton. Two cars loaded out this week are estimated to carry 2 oz. per ton. The Jerry Johnson shaft is the deepest on Ironclad hill, and already operators on other properties adjoining the Forest Queen and W. P. H. are making preparations to sink.

Mine gas, which prevented work in the Forest Queen mine during October—when only seven full shifts were worked—has been successfully combated by the general manager, E. Gaylord. The drift on the 650-ft. level has been bulkheaded, and before the men are lowered to work the compressor is connected with a ¼-in. pipe, entering the drift over the bulkhead. The gas is thus forced back into the rock after 30 minutes. The Forest Queen is now working continuously and producing. The shaft is to be sunk to the 1000-ft. point.

The property of the Yellow Bird Gold Mining Co. on Gold hill, was sold by the Sheriff of Teller county on November 23, under a judgment entered in the District Court in favor of Hildreth Frost, in the sum of $3093 and costs. The judgment creditor was the purchaser.

Red Mountain.—The re-organized Henrietta company, under the management of Edward Walter, will early next year drive a tunnel from the Cement creek (San Juan) side of Red mountain through the mountain at a depth to cor-

respond with the Joker tunnel, with which it will probably be connected on the Ouray side. The Henrietta will be prospected thereby at a depth of 2000 ft. Other properties will benefit by this new work.

IDAHO

Kellogg.—The manager of the Nabob company, William Beaudry, states that a 150-ton mill is to be erected at the mine on Pine creek at an early date. The ore carries zinc, lead, and silver. The Stewart Mining Co. controls the Nabob.

MICHIGAN

Houghton.—Dividends declared payable on December 31 are as follows, per share:

Company	December 31	In 1917	In 1918
Ahmeek	$2.00	$10.00	$16.00
Allouez	1.50	7.50	12.00
Calumet & Hecla	15.00	55.00	85.00
Centennial	1.00	2.00	....
Isle Royale	0.50	2.50	....
Osceola	2.00	10.00	20.00
Quincy	*2.00	8.50	18.00
Wolverine	†1.00	4.00	13.50

*December 23. †January 2.

Mohawk produced 787,149 lb. of copper during October. This was equal to 1.04% ore. Returns this year have varied from 1,088,654 to 711,129 lb. per month.

Wolverine yielded 293,070 lb. in October. Since February, excepting September, there has been a regular decline from the total of 403,736 lb. Ore is yielding only 0.503% copper.

MISSOURI

Joplin.—Production of the Tri-State region last week was 4497 tons of blende, 520 tons of calamine, and 958 tons of lead, averaging $58, $38, and $100 per ton, respectively. Total value was $383,252. Missouri contributed $96,809. There is said to be a stock of 20,000 tons. The movement for an absolute shut-down of the mines in order to absorb the surplus has been changed to what producers believe will prove a more satisfactory arrangement. The smelters have agreed to state in advance how much concentrate they will buy, and the producers' committee will allocate the business to the various mines.

MONTANA

Butte.—The report of Butte & Superior for the third quarter of 1918 shows receipts totaling $1,479,949; operating charges, taxes, etc., $1,334,502; and profit, $145,447. In the previous period the profit was $95,320. Shortage of labor resulted in a lower tonnage mined. Costs advanced owing to increased wages, lower efficiency, etc. The mill concentrated 108,182 tons of ore assaying 15.647% zinc and 6.331 oz. silver. Concentrate contained 51.97% Zn. The total output of metal was 15,426 tons.

Great Falls.—The rolling-mill of the Anaconda company is to make 600 tons of ¼-in. rods for the British government.

NEVADA

Ely.—Nevada Consolidated reports as follows for the third quarter of 1918:

Profit	$890,293
Dividend paid September 30	1,499,593
Red Cross contribution	30,000
Deficit	$639,300
Current assets	16,127,851
Ore milled, tons	1,003,898
Copper content, per cent	1.50
Copper output, pounds	18,643,216
Cost per pound, cents	20.70

The output was nearly 3,000,000 lb. less than in the preceding period. Of the ore, 64% was from Copper Flat and 36% from the Ruth mine. Costs are 3 cents per pound more than before, due to well-known causes.

Goldfield.—Ten lessees are working at the Florence, making occasional shipments to smelters. Lessees in the early days made large profits. At present all pay a 25% royalty. The company rents to them the whole plant, while they pay for supplies, air, and hoisting.

A raise from the 910-ft. level of the Spearhead shows the new shoot to have widened from 2 to 4 ft., the ore still being of high value. Large transactions in shares have taken place on the Stock Exchange at San Francisco, 353,000 changing hands on November 29. The movement in price was from 9 to 7c., then 7 to 16c., closing at 14 cents. On December 2 the shares rose to 27 cents.

The Crackerjack has secured a lease on 35 acres of the Goldfield Consolidated and 15 acres of the Florence.

Ludwig.—Nevada-Douglas mines produced 300,000 lb. of copper in October. Ore sent to the Thompson smelter during the last week of the month amounted to 1150 tons, averaging 3.9%. In the Casting Copper mine, a winze below the 350-ft. level is in 6% ore; in the Western Nevada the 400-ft. level shows 6 ft. of 13.5% ore; and the 700 and 800-ft. levels of the Ludwig, adjacent to the caved stope, show 4 and 5% ore. There are 121 men employed.

Tonopah.—Last week's output of the district was 7189 tons valued at $122,213.

Additional returns for October were:

Mine	Tons	Silver, oz.	Gold, oz.	Profit
Tonopah Extension	9,867	122,076	1,125	$56,542
Tonopah Mining	11,460	106,050	1,004	43,153

The Extension profit is the largest for several months. A dividend of 5c. per share is payable on January 1.

OKLAHOMA

Picher.—Oklahoma fields last week produced 3351 tons of blende and 829 tons of lead, valued at $277,203.

It is said that high royalties demanded from lessees is making it difficult to mine zinc ore profitably. Some royalties run from 15 to 30%, of which the land-owner received from 5 to 10%.

The Oklahoma Ore Storage Association is ready for business. Arrangements have been completed whereby 90% of the average value of the price of the ore placed in the warehouses will be advanced to the owners where desired. Ore will be received after December 1. Every bank in the various districts is behind the movement.

TEXAS

Boquillas.—The Ellis Quicksilver Co. is to erect a furnace and other equipment at its cinnabar mines near this place.

UTAH

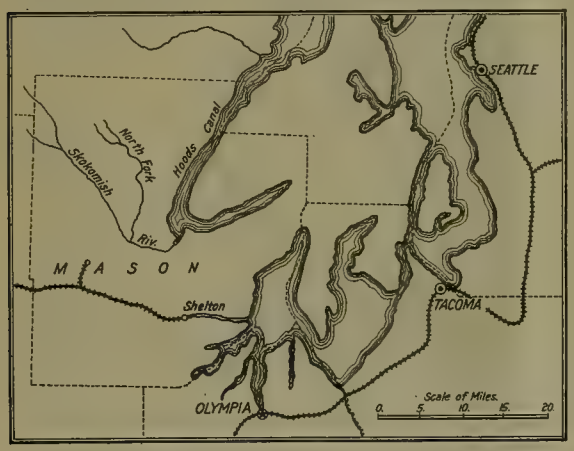
Bingham.—The apex dispute between the Utah Consolidated and Utah Metal company is reported in Salt Lake City to have been settled out of court. The engineers employed are said to have decided that the Utah Metal really had apex rights to the orebodies disputed, so the Utah Consolidated agreed to acquire them. This settlement will have an important bearing on the apex suit pending between Utah Consolidated and the Utah Apex company.

WASHINGTON

The manganiferous area in Mason county, in the Olympic region, which had been examined hastily in 1917, was revisited by J. T. Pardee, of the U. S. Geological Survey, in August 1918. Mr. Pardee also examined several outcrops on the South fork of Skokomish river that had not heretofore been examined and, in company with Henry Landes, director of the Washington Geological Survey, visited some deposits along the North fork. In addition, the Tubal Cain mine, on Copper creek, a tributary of Dungeness river, 25 miles north-east of the Skokomish River deposits, was examined from July 25 to 30, 1918, by Mr. Landes, who has

made the results of his work available to the Federal Survey.

The geologic relations of all the deposits examined are similar. The lodes occur in regionally metamorphosed rocks of probable Jurassic age—greenstones, argillite or slate, and limestone. The greenstones are altered basic lavas and intrusive rocks and form the bulk of the series. The limestone is strongly discolored with iron and manganese oxides, and is closely associated with most of the lodes. The lodes resemble one another in nearly all their features. They are lenslike masses, composed mainly of an uncommon brown hydrous silicate of manganese with which is associated a red jaspery quartz, hematite, and traces of rhodonite, the common silicate of manganese. The manganese minerals are weathered to the common black oxides of manganese to a depth of several feet below the surface. The hydrous silicate of manganese is pale brown material having the fine texture of porcelain and breaks with a con-



THE MANGANESE DEPOSITS DESCRIBED ARE NEAR THE SKOKOMISH RIVER, WASHINGTON.

choidal fracture. Is closely resembles common varieties of hornstone and flint, with which, except for its weight, it might easily be confused. An unweathered specimen from the Black and White group of claims, 18 miles north-west of Hoodsport, contained 46.37% manganese oxide, 23.68% silica, 3.48% alumina, 3.52% ferric oxide, 1.31% magnesia, and 1.56% lime. Although this analysis may not represent the average composition of the largest masses, the unweathered bodies probably contain a large proportion of material having approximately the composition given.

The Tubal Cain deposit consists of bands and lenses of brown silicate developed in a red limestone that forms a practically continuous lode at least 1500 ft. long. The outcrop attains an elevation of 6300 ft., and most of it lies above timber-line, so that the exposures are exceptionally good. The orebody averages 6 ft. in width, and natural cross-sections show that it persists to a depth of at least 500 ft. The part of the body seen is estimated to contain 450,000 tons of ore. The oxidized part is thin, commonly forming but a mere surface shell an inch or two thick.

The outcrops of the deposits along the South fork of Skokomish river are below timber-line and are therefore poorly exposed. The largest body seen is evidently continuous for a length of 200 ft. or more, and for a depth of at least 100 ft. and shows an average width of 8 ft. of ore, and therefore probably contains about 16,000 tons. Another body is 15 ft. wide, but is exposed only for 50 ft. It contains at least 2500 tons. Some smaller exposures represent bodies containing perhaps 2500 tons more. Eight or ten other outcrops that are reported to be similar to those described, were not visited. The bodies examined are probably not limited to their natural exposures, which, as is suggested by the persistence of the Tubal Cain deposit, are only small parts of them, but in the absence of trenches or other workings it is not possible to estimate more exactly their content of ore. Here, as elsewhere, the black oxides, in places at least, form but a thin shell over the brown silicate near the surface.

On the North fork of Skokomish river, at the Triple Trip mine, the workings show a reserve consisting of a small lens of manganese minerals, chiefly the brown silicate. MacKean's claim, which adjoins the Triple Trip, contains a body at least 6 ft. wide and 40 ft. long. On the Apex claim above MacKean's, an open-cut shows 10 ft. of manganese minerals in a lode that is 30 ft. wide, the remainder being red jasper and hematite. At this cut, part oxidation extends to a depth of 6 ft. or more and a particularly interesting oxide occurs in considerable amounts. It is compact, hard, and heavy, and dark green, and therefore should perhaps be classified as the mineral manganosite, an uncommon oxide of manganese. The orebodies on the North fork are not yet sufficiently exposed by workings to warrant estimates of their content of ore, but the natural exposures there warrant an estimate of several thousand tons of ore.

It is evident that the quantity of silicate ore available in the Olympic region is large, and it may perhaps be measured by hundreds of thousands of tons. None of the manganiferous bodies in this region except some on the North fork of Skokomish river have yet been explored. A large amount of development on a supposed copper lode at the Tubal Cain deposit does not exploit the manganiferous orebody.

The deposits on the North fork are more easily accessible than any others here mentioned. The Triple Trip can be reached by a good auto-road from Hoodsport, and by a good road, recently completed, from Lake Cushman, 6 miles away. The railway of the Phoenix Logging Co. has been carried to the lower end of Lake Cushman and, it is said, is soon to be extended to the mine. Although the deposits on the South fork are but 6 miles in a straight line from the Triple Trip, the country is so rough they can be reached, even on horseback, only by a circuitous route covering 20 miles or more. A wagon-road could doubtless be built up the South fork, but it would have to climb over two or three high points or cross the stream several times. The size and the elevation of masses of stranded driftwood along the stream indicate that a permanent bridge across it would be rather expensive. If the deposits at the Triple Trip should prove to be workable, a wire rope or other form of tramway across the mountains would perhaps be the most practicable means of transporting ore from them. Although the visible ores of the Olympic mountains are more silicious than ores from which ferro-manganese is commonly made and cannot therefore be smelted advantageously in the blast-furnace, they could be melted to silico-manganese and to standard grades of ferro-manganese in electric furnaces if cheap electric power were available and other conditions were favorable. H. H. Piper of Olympia has two men at work on the Apex claim. In association with Mr. MacKean he proposes to erect a small electric furnace at the foot of the mountains to make ferro-manganese from ore from the Apex and adjacent claims.

CANADA

British Columbia

Anyox.—Granby Consolidated produced 1,932,870 lb. from its mines here in October, and 616,604 lb. at Grand Forks, a total of 2,549,474 lb. This is a drop of 820,000 lb. from September.

Kamloops.—The well-known Homestake silver mine has been sold to La Rose company, of Cobalt, Ontario. This is the second Cobalt company to enter this Province, the Min-

ing Corporation having recently acquired the Woolsey property near Revelstoke. The Homestake was disposed of by Byron R. Jones and associates of Vancouver, who had secured the property under option. This mine was operated 22 years ago, but its then owners were unable with the processes then in use to extract more 70%; so work was suspended. With present methods the Homestake should be among the producers again. H. D. Cameron will be in charge. The Homestake is situated in the Kamloops mining division, 18 miles from the Canadian Northern Pacific railway, at an elevation of 2600 ft. It consists of four crown-granted mineral claims, or 191.44 acres. A 190-ft. tunnel has been driven. Samples taken last year from the vein at the mouth assayed 7.78 oz. silver, 0.22% copper, with a little gold.

Nelson.—The Queen, Vancouver, Kootenay Belle, and Alexandra mining claims, on Sheep creek, have been consolidated under control of A. W. McCune of New York. For some time it has been the opinion of engineers that these properties would have to be placed under one management to be successfully operated. Sheep Creek has been a producer of gold since 1900. The Queen has yielded metal from 1900 up to two years ago, when, as a direct result of labor difficulties, operations were suspended. In that time the camp produced $2,500,000, of which the Queen was responsible for $1,312,654 and the Kootenay Belle, $104,972. Work has been commenced upon the portal of a 3000-ft. cross-cut tunnel, commencing at the Malwaaz (one of the claims) running south-east across the several properties to the Alexandra. This is expected to cut several parallel veins. The new pipe-line from the compressor to the new portal is also under way. About 25 men are being employed, this number to be increased to 200. New development will entail an expenditure of over $200,000. The erection of a 200-ton mill, replacing the old Queen plant, is contemplated, and buildings are being remodeled and renovated. A power-line and telephone service with Nelson are being arranged. The manager in charge is Marcus M. McCune.

Princeton.—The Voight copper property on Copper mountain, near here, has been acquired by the Consolidated Mining & Smelting Co. This is one of the best known low-grade properties in the Province, the claims covering 6000 acres. They have been in the possession of Emil Voight for several years.

Trail.—Ores received at the smelter here during the first 9 months of the current year totaled 271,417 tons, compared with 327,639 in 1917, and 415,983 in 1916.

Yale.—The Snowstorm group of five highly-mineralized copper-silver-gold claims, situated in Highland valley, will be prospected by the Provincial Department of Mines by diamond-drilling under the terms of the Mineral Survey and Development Act. Announcement to this effect has been made by Hon. William Sloan, Minister of Mines, and tenders are being invited for 10,000 ft. of drilling.

The International Diamond Drill Contracting Company of Spokane, has been awarded a contract by the Minister of Mines of British Columbia for 10,000 ft. of drilling on the Snowstorm group of copper-silver-gold claims, in Highland valley. This is the same company that has been engaged in the exploration of Copper mountain for the British Columbia Copper Co., for which concern it drilled a total of 100,000 ft. The Government work will start at an early date.

Ontario

Cobalt.—Kerr Lake produced 200,220 oz. of silver in October, rather below recent months.

Nipissing yielded silver worth $278,468 in October. This is the highest output since July, when it was 304,694. There was treated 178 tons of high and 6882 tons of low-grade ore. The refinery shipped 401,423 oz., including custom metal. On No. 4 level of No. 73 shaft the vein has widened from 1 to 4 in., assaying up to 3000 oz. per ton. At 96 tunnel two soft veins, 2 in. wide, were cut, carrying 1500 oz. Other developments were satisfactory.

Kirkland Lake.—The Lake Shore company pays a dividend of 2½%, equal to $50,000, on December 10. The company also subscribed $50,000 to the Victory Loan. Since the mill started in March it has treated 13,128 tons of gold ore worth $325,550.

Porcupine.—The Schumacher Mines is to issue 100,000 treasury shares. During the year ended March 31, 1918, a loss of $7695 was made; while from April 1 to July 15, 1918, there was a profit of $8675. Current assets on March 31 were $51,379, and liabilities $54,992. The mill capacity was increased to 180 tons per day, while machine-drills were increased from 14 to 25. These additions cost $50,981. The two periods compare as under:

	12 months	4½ months
Ore treated, tons	.....	45,373
Average value per ton	.....	$5.71
Gold extracted	$202,387	$242,060
Profit or loss	−7,695	+8,675
Cost per ton	.....	5.15

Ore-reserves in July were valued at $600,000.

The Schumacher has decided to sink its shaft from 1000 to 1200 ft. depth.

The Hollinger Consolidated company has subscribed $1,750,000 to the Victory Loan. The company pays a dividend of 1% on December 2. This is equal to $246,000, and makes $984,000 for 1918, and $9,018,000 to date.

Sudbury.—The International Nickel Co., in the six months ended September 30, 1918, reports earnings of $7,809,342. Deducting $381,843 for administration and general, $2,749,126 reserve for taxes, and $995,090 for depreciation and mineral exhaustion, the profit left was $3,683,283. Preferred shareholders received $267,378, and common shareholders $1,673,384.

MEXICO

Chihuahua

Juarez.—According to business-men in Mexico, both American and Mexican gold money are comparatively plentiful in Juarez and Chihuahua. In September and even later American gold was at a premium of 10%, and is now down to about 1%, according to the 'El Paso Herald'. Mexican gold was selling a short while ago at a premium of 13% or 63 cents for a Mexican peso, but the premium is now down to 2%. It has been and is cheaper to buy American gold than Mexican. Operators across the line have been doing this. Of course they could get the gold from their banks on this side to pay operating expenses in Mexico, as the United States government gave permits for such export to Mexico, and this accounts for the increase of the quantity of American gold money. Carranza's presidential decree for American gold to pass at the rate of one for two of Mexican gold is another factor in making the premium lower than the latter, say those doing business in that country. It is also thought that the possible early release of gold after the signing of the armistice in Europe is a factor in lowering the premium on coin of that metal in Mexico. Another thing attributed by men doing business in Mexico to the prospective early improvement of business and other conditions after peace in Europe is the increasing value in the market of the price of the bills of the old banks of issue in Mexico. The bills that have been quoted the highest right along are those of the Banco Nacional, now up about 22 cents gold. A few of the other banks' bills have been rising slowly also. Still another kind of Mexican money also rising in value slightly is the 'infalsificables', or 'uncounterfeitable' money issued by Carranza. To withdraw this money from circula-

tion, Carranza had issued a decree that with every peso of duties paid in gold there should be with it one peso of 'infalsificado.' The result is a growing scarcity, and that class of money has advanced from half a cent gold per peso to two cents or better.

Santa Eulalia.—G. M. Hillard and associates who are working the El Cristo mine in this district, are making regular shipments of ore to the A. S. & R. smelter at Chihuahua. It is stated that ore recently opened carries over 1200 oz. silver and 60% lead. Before passing into the hands of the present owners, El Cristo is said to have produced more than $3,000,000 of ore.

Mexico

Mexico City.—In a report just issued by the Department of Industry, Commerce and Labor, statistics are given of the mineral production of this country for the year 1917. There are in Mexico a total of 25,063 mining properties. The gold and silver mines are most numerous, totaling 9840; silver mines total 5804; lead and silver, 4281; and gold, 1800. One mine produces jacinet, nine mines opals, one bismuth, two rock-salt, fifty-three sulphur, thirty-nine manganese, two molybdenite, one fluorspar, and one hundred and nineteen mines produce mercury. The State of Mexico occupied first place in gold production, having yielded 68,000 oz.; Hidalgo was next with 59,000 oz.; and though in former times it was famous for its output of gold-bearing ores, Guanajuato produced only 300 oz. Hidalgo took first place in the output of silver, with 10,750,000 oz.; Aguascalientes was next with 3,300,000 oz. The output of all the mines, in kilogrammes, was as follows: gold, 5788; silver, 648,684; copper, 141,528; lead, 26,769; zinc, 3388; and antimony, 2140.

Sonora

Cananea.—Greene Cananea Copper Co. paid $2 per share, on the $100 shares only, on November 25.

KOREA

Unsan.—Gold production of the Oriental Consolidated in October was $92,000.

LOCAL SECTION A. I. M. E.

L. D. Ricketts will address the local section of the A. I. M. E. in San Francisco on December 10, and exhibit the films showing operations at the New Cornelia and Inspiration mines. These films are unusually fine and, with the descriptions to be given by Dr. Ricketts, should prove interesting.

A local branch of the American Zinc Institute is to be organized at Picher, Oklahoma, as decided by a large meeting of mine-owners two weeks ago.

Obituary

George Reinmiller, assistant superintendent for the Engels Copper Mining Co., died of influenza on November 7 at the mine, in Plumas county, California.

Robert M. Green, manager for the Butte Copper Czar Mining Co., at Butte, Montana, died from the after-effects of influenza.

Bruce White, one of the first prospectors and mine operators in the Slocan district of British Columbia, died on November 15 at the Kootenay Lake hospital of pneumonia following an attack of influenza.

Benjamin Harrison Dosenbach, consulting flotation engineer for all the companies under Mr. Jackling's direction, died at his home at Butte on November 26 from an attack of pneumonia following influenza. He was a graduate of the Missouri School of Mines, '09, and was married only a few months ago. His untimely death will be deeply regretted by a large circle of friends.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

J. R. Finlay is at Tucson, Arizona.

John Hoffmann has returned to Oakland from Siberia.

M. H. Burnham, of New York, was in San Francisco this week.

Dalby B. Morkill, formerly at Hazelton, is now at Vancouver, B. C.

T. H. Jenks, consulting engineer of Phoenix, Arizona, is at the Chancellor hotel.

C. C. Gordon passed through San Francisco on his way from Lima, Peru, to New York.

Frank L. Cole, of Shanghai, arrived in San Francisco on the 'Korea', on his way to New York.

A. B. Howe has resigned as secretary-treasurer of the Goldfield Consolidated Mines Company.

A. W. Stickney is making an economic examination of the island of Cyprus for a British syndicate.

Blamey Stevens, who was in San Francisco last week, will return shortly from Los Angeles to Nogales.

W. L. Honnold, until recently director at New York of the Commission for Relief in Belgium, is now residing in Paris.

J. Power Hutchins, who was attacked by influenza on his arrival in San Francisco, is convalescing satisfactorily at Del Monte, California.

C. W. Adams, assistant superintendent of the Murray plant of the A. S. & R. Co. at Salt Lake City is making a visit in San Francisco.

Henry Smeddle, Captain in the 15th Battalion, B. E. F., has been awarded the Military Cross and promoted to second in command of the 25th Battalion.

William McMahan, formerly with the Granby company, has been promoted to Second Lieutenant in the Corps of Engineers, U. S. A., 49th Co., 20th Engineers.

Henry Schnitzel, general manager for the Golden Reward Consolidated at Deadwood, South Dakota, is in California. He is interested in placer ground near Nevada City.

A. H. Brown has resigned from the management of the Hudson Bay Mines, at Cobalt, and the Dome Lake M. & M. Co., at South Porcupine, to take up other work in January.

E. B. Thornhill has resigned as manager of the New York office of the General Engineering Co. to take a position with the Chino Copper Co. as research engineer, effective December 1.

Edgar Rickard has been appointed chairman of the executive committee of the Commission for Relief in Belgium. He continues to be Mr. Hoover's chief assistant in the Food Administration.

Forest Rutherford, consulting metallurgical engineer, has returned to New York from Colorado, where he spent the summer months making mill-tests on some interesting ores from the Breckenridge district.

L. J. Mayreis, formerly assistant-manager for the Burma Mines, Ltd., has been made manager of the new zinc smelter and sulphuric acid works that the Burma Corporation is building at Sackchi, in India.

Roy H. Allen, recently said to have been commissioned Captain in the Quartermaster Department of the Aviation Service, is Captain in the Aircraft Production department of the Air Service and is stationed at Dayton, Ohio.

THE METAL MARKET

METAL PRICES

San Francisco, December 3

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	10.00
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	7 30— 7.80
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$120
Spelter, cents per pound	10.50
Zinc-dust, cents per pound	16.00

ORE PRICES

December 3

Chrome, no definite quotations available.	
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% MoS_2	$1.25
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, per unit	$20—$26

EASTERN METAL MARKET

(By wire from New York)

December 3.—Copper is unchanged, but casting copper is quoted at 23c. Price of lead was reduced on December 2 to 7.05c. Spelter is dull though steady.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government has fixed its maximum at 49½ pence.

Writing on November 9, Samuel Montagu & Co. of London say that no change has taken place in the state of the silver market, though the recent reduction in insurance rates will doubtless be reflected in the price of silver. News has been cabled officially from India that the weather outlook is gloomy. It is stated that rain is insufficient everywhere, and that famine conditions are expected in the Bombay presidency. By mail leaving Bombay on September 18 it was stated that a moderate amount of silver in the shape of ornaments was then arriving from up country for realization, owing to the insufficient rainfall. At present the untoward course of events does not seem to be shown in the currency returns, where the silver holding from week to week increases but slowly, notwithstanding fresh purchases in America.

LEAD

Lead is quoted in cents per pound. New York delivery. Early in July, producers agreed to fix prices at 8.05c. per lb., New York. This was reduced to 7.05c. on December 2.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, which have since been extended to January 1, 1919, prices to be effective on the day of shipment, not the day of sale. Quotations in cents per pound are as under:

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

The zinc-ore market at Joplin, Missouri, is far from satisfactory, with small sales. A large surplus of concentrate is on hand. The agreed price for second-grade material was $52.27 per ton.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefore $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

Tin is now selling at 71 cents per pound.

ORES (New York)

Antimony: Needle antimony and antimony ore have not been quoted for some time, and it is exceedingly difficult to arrive at a price basis for either of these.

Molybdenite: There does not appear to be any new development. Works that own their mines seem to be fully occupied with the manufacture of ferro-molybdenum, but there is practically no open market for any ore or ferro to be found late in November, according to Charles Hardy.

Tungsten: Interests identified with the tungsten industry met in New York last week and appointed a committee to report on the situation. In the meantime no business is reported in ores, and it is uncertain as to just what their prices are. It seems certain that no longer can as high as $25 to $26 per unit be realized. For ferro-tungsten as high as $2.50 to $2.60 is said to have been quoted, but no business at these levels is reported.

Eastern Metal Market

New York, November 27.

The more important markets continue under regulation, with no definite information as to when they will be made open markets.

Copper is to remain under control until January 1 at least.

Tin is under international regulation, except in re-sale metal in this country.

Lead is still in the hands of the Lead Producers' Committee.

Zinc is an open market as to lower grades, and is more active and stronger.

Antimony has assumed a firmer tone.

The leading news feature in the steel trade is the announcement of plans for the formulation of an organization of independent steel companies to look after export trade. So far, 28 companies, representing an ingot production of 20,000,000 tons per year, have given informal approval of the project, and a New York charter will soon be secured for the Independent Steel Products Corporation. This will take in a large part of the capacity outside of the U. S. Steel Corporation which has its own export sales unit. The companies represented propose to devote 10% of their output to export trade, regardless of fluctuations in domestic demand. New inquiry, and particularly that of an export nature, has given a new turn to steel trade sentiment in the last week, after two weeks of cancellations. As to prices for export trade, there is no definite level yet, except that for such transactions as have been reported, higher than fixed domestic prices have been realized or quoted. The Steel Section of the War Industries Board has notified all manufacturers that it would discontinue allocations of steel on November 30.

LEAD

There is no change in this metal, which continues under the control of the Lead Producers' Committee, with all distribution of orders regulated by it at the fixed prices of 7.75c., St. Louis, or 8.05c., New York. One dealer in lead expressed a personal opinion today to the effect that probably this metal would be the first to be released from control because the regulation of the market is voluntary. This, however, is not likely to happen until supplies are larger than at present. Lead made from foreign ores is being offered at 7c., New York, in bond.

COPPER

The entire future of the copper market rests on the question as to its control. The only definite factor is that prices have been regulated until January 1, and that a meeting has been arranged between producers and Government officials for about the middle of December to determine the future policy. It is difficult to get a line on actual conditions, the entire situation being still under the close control of the Copper Producers' Committee. Little is heard of any cancellations—foreign or domestic—and their advent does not seem to be as much of a factor as in the steel market. Considerable has been heard, particularly in the stock market, of sales of copper under the fixed prices. It turns out that any such sales have been of casting copper only, some of which has gone as low as 24.50c. per lb. This is not a new happening, though the price is a low one. It is understood that no re-sale of electrolytic or Lake copper is permissible under the regulations. The principal news feature of interest has been the reported formation of a combination of American producers and sellers to control sales for export. Details are not available, but the truth of the report is indirectly acknowledged. It was brought about partly by the reported organization of foreign governments to arrange purchases in this country and to protect themselves. An interesting speculation has been brought up as to what may happen to copper held by manufacturers for Government account. Little is heard of new domestic inquiry, but it is stated that the Anaconda company has just closed a contract to furnish the British government with 1,200,000 lb. of ½-in. copper rods delivered at British ports.

TIN

The market is virtually a controlled one, all future shipment buying being done by the U. S. Steel Products Co. There are many interesting situations developing as a result of this, and it may be possible to say more about it later. A talk today with a large importer opened many interesting possibilitiees. Suffice it to say that the impression is growing that a huge mistake has been made in international control of the market, particularly as it came at a time when it was not necessary. It is evident that stocks in consumers hands are much larger than supposed, and that much of the metal now bought and allocated to this country is at high prices. The only open market is in the re-sale of such tin as consumers and dealers desire to get rid of. There has been more of this lately, enough to test the market really in a moderate way. Sales have been made from 75c. per lb., New York, a week ago, to 71c. per lb. yesterday, which is the spot quotation, principally for Straits and Banca tin. Arrivals of tin at Pacific ports so far in November have been 1975 tons, with only 100 tons at Atlantic ports. On Monday the 25th the London market for future shipment was £300 per ton, or 68c. per lb. in London with exchange at $4.75½.

ZINC

The market has taken on a decidedly better tone as a result of fairly large buying both for domestic consumption and for export. The former has been for the use of galvanizers who have long been out of the market, and the movement is distinctly on a peace basis. As a result of this buying, quotations have firmed appreciably and the position of the market is regarded as strong. Prime Western for December delivery is selling at 8.20 to 8.25c., St. Louis, or 8.55 to 8.60c., New York, with prompt delivery at 8.40c., St. Louis, or 8.75c., New York. For first quarter the quotation is 8c., St. Louis, or 8.35c., New York. Producers as a rule are what may be termed shy sellers.

ANTIMONY

The peace scare is evidently over in this market, and on some demand the market has strengthened to 8.50 and 8.75c., duty paid, for wholesale lots for early delivery.

ALUMINUM

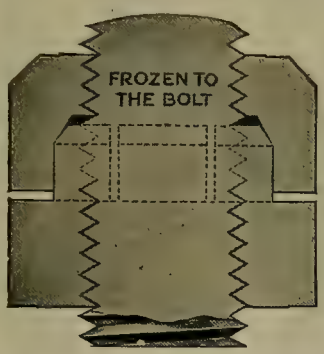
There has been no announcement of a change in the maximum Government price for No. 1 virgin metal and for scrap, which continues at 33c. per lb. for 50-ton lots; 33.10c. per lb. for 15 to 50-ton lots, and 33.20c. per lb. for 1 to 15-ton lots.

Manganese alloys: Re-sale lots of spiegeleisen are appearing, but so far no transactions are reported. The conditions are such that these could be parted with at a concession under the present quotation of $70, furnace. Sales of only small lots of ferro-manganese are reported at $250, delivered, for 70% alloy. Demand for both alloys is light.

INFORMATION FURNISHED BY MANUFACTURERS

THE DRAKE LOCK-NUT

The Drake lock-nut was devised and patented by George F. Drake of San Francisco. He states that it was his idea to develop a device in a lock-nut that would securely lock on the bolt, at the same time be a simple and correct mechanical job, and one that could be manufactured at a consistent price. The first illustration is a scale drawing of a 1-in. U. S. Standard. The lower, or nut-member, has an ample wrench-hold to turn up the nut and pull the work into place, giving it a micrometer adjustment. After this, the upper or locking-member is turned down, and the contact occurring only on the 25° angle at the top of the boss, which is made flexible by slotting, the lower member is



securely locked on the bolt at the point of adjustment first obtained without lifting the load off the lower member onto the upper member. This is explained by the fact that the two members never contact or seat on a horizontal line at the bottom or top of the boss. The seat or contact occurs on the annular bevel at the top of the boss and the interior annular bevel in the upper member, which is situated at the 'centre of the mass' and point of greatest strength of the upper member. This bevel being 25°, and 20° in larger sizes, has a much greater element of shrink than of lift, thus locking the flexible finger members of the lower member on the bolt without lifting the load already hanging there.

The second illustration shows that the device makes a complete finished job, for the corners of the 'hex' can easily be matched up in locking. The total height of the Drake lock-nut equals a standard nut and check-nut, and they are made in ¾ to 1-in. sizes (Society of Automatic Engineers) and ¾ to 2-in. United States standard.

The Drake lock-nut is manufactured by the Drake Lock-Nut Co., Folsom and Tenth streets, San Francisco.

VERTICAL GENERATORS FOR WATER-WHEEL DRIVE

To utilize our water-powers to the best advantage, water-wheels and generators must both be designed to meet the conditions encountered. These conditions vary widely, and the range in capacity and speed demands an equally broad experience.

Single-runner vertical wheels, of exceptionally high efficiency, are now available for at least all of the low and medium-head water developments; and it is to be expected that the majority of our future installations will be of this type. The success of the vertical type depends on the satisfactory operation of the thrust-bearing carrying the weight of the revolving parts.

One of the most frequent causes of generator shut-downs has been, and probably will be, failure of the armature insulation. By a happy choice, Westinghouse Electric & Mfg. Co.'s engineers early decided on mica, a material that does not age, is unaffected by temperatures far higher than those in the modern well-ventilated generator, and remains unimpaired under the static discharges common to all high-voltage machines. Efforts have been directed for many years to the perfection of their methods in the application of this material as armature coil insulation. Proof that this early choice was a most logical one is found in the increasing use of this material by all manufacturers of electric machinery building large capacity and high-speed machines.

The danger of runaway speeds, 50 to 100% above normal, is ever present in the hydro-electric plant, and a rotor construction that safely withstands the stresses incidental to this abnormal condition, is essential. No single type of construction will cover, with safety and economy, all the range of capacity and speed encountered. Cast-iron is satisfactory only for low-peripheral speed rotors; steel castings, if of large size, may not be sufficiently uniform in strength to rely on; laminated-steel rims and rolled-steel plates are sometimes resorted to for high-speed service.

COMMERCIAL PARAGRAPHS

The Detroit Graphite Co. has a service flag indicating that twenty of its employees are in the Army, save one in the merchant marine. Bulletin No. 1, which contains copies of letters sent from the front, has been published.

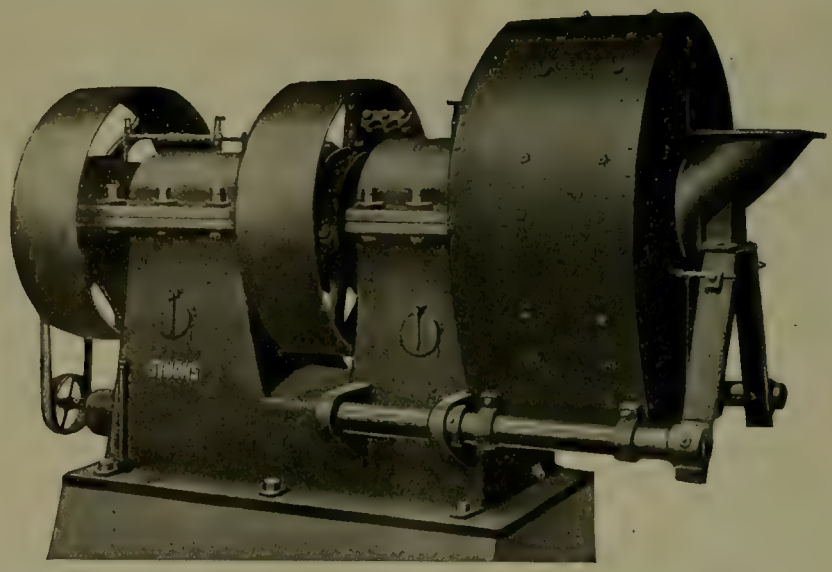
Following a recent meeting of the directors of **Fairbanks, Morse & Co.**, of Chicago, C. H. Morse, Jr., the president, announces several new and important changes covering the active management of the business: R. H. Morse has been elected vice-president in general charge of purchasing and traffic. His connection with the firm covers many years of varied experience in both sales and manufacturing departments, and he continues his duties as a director. C. W. Pank rises from general director of sales to vice-president in charge of sales of all factory products. W. S. Hovey, formerly general manager of the firm's large manufacturing plant at Beloit, Wisconsin, has been elected vice-president in charge of general manufacturing at all factories. W. E. Miller becomes vice-president and treasurer instead of first vice-president. F. M. Boughey retires from the position of treasurer to become secretary and comptroller.

"Turned My Plant From a Failure to a Gold Mine"

A user wrote that.

This is what did it:

SYMONS DISC CRUSHER



The crusher that will surprise you by its performance—its economy—its efficiency—its freedom from repairs—its uniformity of product.

We have records—records that stand by themselves—of crushers in operation 2 and 3 years with *no change of discs* and *no lost time on account of breakage.*

Superior to rolls, jaw or gyratory crushers on most classes of work.

Inform yourself—write or wire for details.

THE METAL MARKET 809
INDUSTRIAL PROGRESS 811

Established May 24, 1860, as The Scientific Press; name changed October 20 of the same year to Mining and Scientific Press.

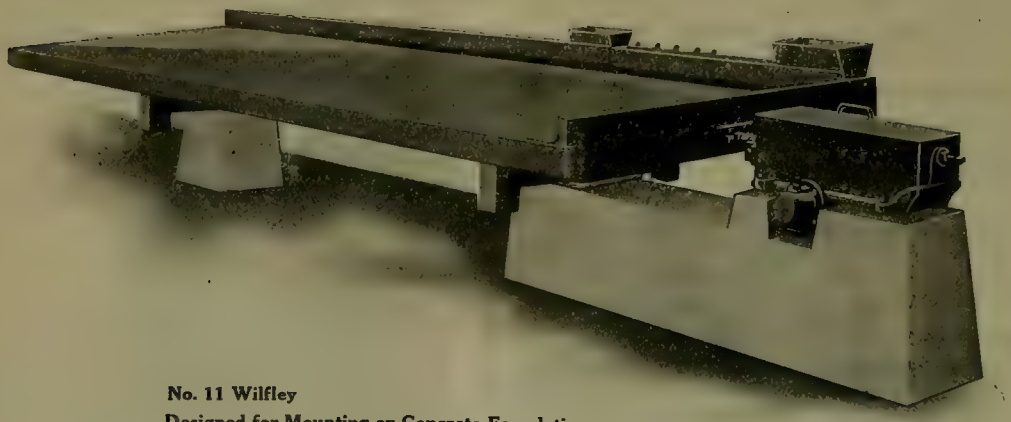
Entered at the San Francisco post-office as second-class matter. Cable address: Pertusola.

Branch Offices—Chicago, 600 Fisher Bdg.; New York, 3514 Woolworth Bdg.; London, 724 Salisbury House, E.C.

Price, 15 cents per copy. Annual subscription, payable in advance: United States and Mexico, $4; Canada, $5; other countries in postal union, 25s. or $6.

The WILFLEY Concentrating Table With CONCRETE Foundations!

Another Improvement Added to the Famous Pioneer Concentrating Table



No. 11 Wilfley
Designed for Mounting on Concrete Foundation

As an aid in the conservation of steel the No. 11 Wilfley has been designed for mounting on concrete foundations.

Shipping weight only 2000 lbs.

The new Wilfley maintains the old Wilfley principles and the same Wilfley efficiency both in mechanical construction and metallurgical operation.

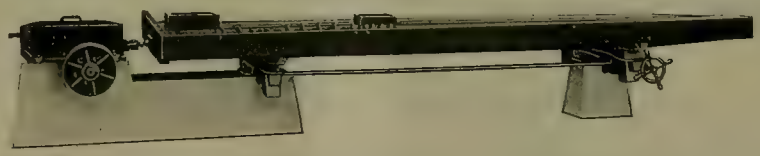
Note the extreme simplicity of the understructure as shown below.

Only a Wilfley Table could carry such improvements without radical changes in design. Where concrete is available the savings in purchase of the No. 11 Wilfley are threefold.

First—**Saving in first cost.**
Second—**Saving in shipping charges.**
Third—**Saving in erection charges.**

The Wilfley always leads—others follow.

No. 5, No. 6, No. 9, No. 10 Wilfleys are also available for prompt shipment.



The Quincy Mining Co., Hancock, Mich., have recently installed 10 No. 11 Wilfleys.

THE MINE & SMELTER SUPPLY COMPANY

A Service Station Within Reach of You

Denver **Salt Lake City** **El Paso**

New York Office: 42 Broadway

Pacific Coast Representatives, HARRON, RICKARD & McCONE, San Francisco, Cal.

EDITORIAL

WE publish a circular issued by the American Mining Congress on the chrome-manganese scandal and on another page we print an important article on the subject written, at Washington, by Mr. Courtenay De Kalb.

GOLD and its status in the world of business continues to be a timely subject. The great process of rehabilitating industry and restoring international commerce will be influenced profoundly by any change in the appreciation of the standard metal. This being so, our readers will be glad to have the eminently sane and thoughtful article by Mr. Blamey Stevens, who brings to economics the common sense and scientific study that have marked his incursions into mining geology.

AMONG the great men at the Peace Conference the most interesting is Clemenceau. Of the deputies in the National Assembly of France that signed the solemn protest against the cession of Alsace-Lorraine on February 18, 1871, he is the only survivor. At the age of 78 he has lived not only to see his fondest hope realized but he has the proud satisfaction of having been Premier in the Cabinet that led the French people to complete vindication of the wrong done by the Prussian 47 years ago. His sobriquet of 'the Tiger' and the name of his paper 'L'Homme Libre' serve to suggest alike his tenacity as a politician and his liberalism as a man. To no man of this generation has it been given so completely to crown his career by the accomplishment of a noble purpose.

ENGLISH, it is reported, is likely to be the language of the forthcoming conference at Versailles. This is due in part to the inability to speak French of several of the principal representatives and in part to the fact that the representatives of France can speak English. The great Clemenceau was teacher in a young ladies seminary in Connecticut for four years and married an American girl, so that he speaks not only English, but American. Mr. Lloyd George speaks some French but not enough for the delicate shades of meaning involved in the making of a treaty of peace. Mr. Wilson does not speak French. Signor Orlando speaks English. Mr. Balfour speaks French fluently. Of the American representatives, only Mr. White is at home in the language of diplomacy. The reasons for conducting the negotiations in English are obvious. If our language is adopted for this momentous occasion it may be regarded as a tribute to the influence of the English-speaking countries in the national council, but it will be also an evidence of the lack of linguistic ability characterizing most Americans and many Englishmen as compared with the statesmen of continental Europe.

AT the close of the year the War Industries Board will cease to exist. It is announced that Mr. Bernard M. Baruch has tendered his resignation as chairman of the Board. We have not been predisposed to admire Mr. Baruch's activities at Washington because we do not like to see men of his type—that of brokers, speculators, and promoters—placed in the position of regulating competitive forms of industry, but it must be conceded that Mr. Baruch has risen superior to his previous training and proved himself both a conscientious and a capable administrator. Now that the War Industries Board ceases to exist, it will devolve upon the Bureau of Mines to perform such of its functions as survive the cessation of war. The Bureau will have a good opportunity to prove itself the best friend that mining has at Washington.

ON December 3 the indictments against those responsible for the deportation of the I. W. W. at Bisbee in July 1917 were quashed by Judge William W. Morrow in the U. S. District Court at Tucson. The indictments had been returned against 25 men many of whom were prominently and honorably connected with mining operations in the Warren district. The deportation expressed the bitter feeling aroused against the anarchistic phase of the labor movement and followed the strike of copper miners that had threatened the safety of life and property at Bisbee. At the time we expressed regret that men known to us as good citizens should have taken the law into their own hands and adopted measures so destructive to the welfare of democratic government. Their excuse is that the Federal government, despite an appeal from the Governor of the State, did not send troops to quiet the disorder and no other military force existed for the purpose at that time because all the State troops had been mustered into the Federal service. The trouble was fomented by the I. W. W., assisted by Austrians and Mexicans, who resorted to intimidation and violence against the men, Americans and other

orderly elements, that continued at work. Thus, it is argued by the mine operators and engineers, the deportation became a regrettable necessity. On the whole we are glad that the incident is closed, but we hope that it will be regarded, not as a precedent, but as a lapse from the code that should govern those loyal to the principles of law in a free commonwealth.

CAMOUFLAGE gained fresh significance when Hearst printed the British flag on his papers last Saturday, which was the day set aside for celebrating Great Britain's part in the War. On the same day newspapers all over the country were publishing excerpts from the evidence offered by the Department of Justice to the Senate committee investigating the relations between the brewers and German propaganda. The evidence included a dispatch sent by Von Bernstorff on June 2, 1916, to the German Foreign Office, in which he said that the "Hearst organs have, during the course of the war, always placed themselves outspokenly on our side." The German ambassador also said that "Hearst is not aware that Hale is our agent, but knows him only as a Germanophile journalist who has contributed leading articles to papers." The 'only' is eloquent. Mr. Hearst should not fly other peoples' flags but use the one that he serves.

BRISBANE, under his contract with Hearst, writes what he pleases and Hearst publishes it "if he wants to," so said Mr. Arthur Brisbane himself to a committee of investigation at Washington. He 'pleases' to write some pitiful drivel occasionally, as, for example, recently in 'The Examiner' on the subject of molybdenite. This, Mr. Brisbane says, is "the new precious metal . . . It is found on high peaks, sometimes thickly crowded with the metal . . . Thousands are digging in the snow . . . The new metal that has caused an excitement like the gold fever is used to harden the rifling inside of [sic] cannon. The prospectors apparently believe [with Hearst] that rifled cannon shall be needed [against England and Japan?], and they are probably right [the gospel according to Hearst]. Molybdenite is the necessary brother of gold, the other precious metal [sophomore high-school!]. As long as men hunt for gold they will want molybdenite to rifle the cannon to protect their gold." This precious nonsense is foisted on an untechnical world with all the glitter of irresponsible journalism. From it one can infer how safe Mr. Brisbane is as an educator of the people à la mode de Hearst.

OUR friend 'The Mining Magazine', in London, has gone through the period of the War with success and credit, thanks to the energy and business acumen of Mr. W. F. White and the good editorship of Mr. Edward Walker. We note, in the November issue, apropos of the passing of Henry R. Merton & Company, an editorial expression of regret at "this abuse on the part of the public of German or Anglo-German metal firms and the wild talk about strangling by the insidious octopus. Everybody in the metal trade knows perfectly well that the Australian metal output was lost to England because German buyers gave better prices and prompter cash, and because they financed mines for the sake of the metal output and not with the object of creating a gamble on the Stock Exchange." We do not share this view, but we give it because it is interesting. Some of the assets of Henry R. Merton & Company are being taken over by the Central Mining & Investment Corporation, identified with Wernher, Beit & Company.

GOOD LUCK to the President on his journey to Europe! Whatever the political color of our citizens, all must unite in wishing him success in the great work he has in hand as the spokesman of the United States. Meanwhile the press of this country needs to summon all its resources of moral earnestness in the effort to lead public opinion to a consistent support of the high principles that should guide the peace conference. The President will suffer less from the scurrilous attacks made upon him by such political opponents as Mr. Roosevelt and Senator Sherman than from the mawkish adulation of certain democratic newspapers. For instance, the description of the President at work on board ship preparing a speech that is to "mark a milestone in the history of mankind." Such flattery makes it hard for the man that is to deliver the speech. Likewise the description of the President as "the world's deliverer"; that is an exaggeration that only throws ridicule on the splendid work he has done and is going to do. Let us give him, not unreasoning adulation, but united support.

BEFORE the War the name of Zabern was eloquent of Prussian tyranny in Alsace-Lorraine. Zabern is a little town on the border of the two restored provinces. In November 1913 it engaged the sympathetic interest of the world because it was the scene of several intolerable acts of brutality by German militarists. A lieutenant, named von Forstner, struck with his sword a lame cobbler who was slow in getting out of his way on the street. When the people of the town protested the colonel of the regiment, von Reuter, declared martial law and the little town was terrorized by the German garrison. A court martial acquitted the two principal offenders and the Crown Prince sent his personal congratulations to von Forstner. What is the sequel? Forstner was killed by his own men in the early days of the War; Reuter fell in battle during the first invasion of northern France; the regiment that terrorized the good people of Zabern was annihilated; the lame cobbler has lived to welcome the entry of French troops into the town; the Crown Prince is in a hamlet on the Zuyder Zee and is talking nonsense to irresponsible reporters; Alsace-Lorraine is a part of France.

SUNDRY cheerful analogies have been drawn between 1865 and 1918, the expansion of industry after the Civil War being taken as a hint of similar good times after the greatest of all wars. No industrial prostration followed the conflict between the North and South, on

the contrary the sequel was a prompt return of prosperity and a remarkable increase in railroad building, which stimulated business of every kind, including mining. The Western States, notably those of the Pacific Coast, underwent intensive exploration at the hands of former soldiers and new immigrants. The analogy will scarcely hold today, because the West has been over-run by prospectors during the interval between the two wars cited and the search for certain minerals was particularly intensified during the four years of the European war. Nevertheless the demand for metals will be a favorable factor to renewed search and the resumption of railroad construction may facilitate mining operations in districts now handicapped by lack of cheap transportation. If the analogy be pursued, it may be anticipated that the zest of the American explorer will reach forth into neighboring lands, notably Canada and Mexico.

Captain De Lamar

The death of Joseph R. De Lamar robs the mining world of one of its most notable personalities. Capt. De Lamar's career was romantic, for he ran away to sea from Amsterdam when a boy and became master of a ship trading between the Bermudas and New York. In 1878 the lure of the Leadville boom brought him to the West, where eventually he became one of the most active and successful of mining adventurers. He made money out of mines in Idaho, Utah, and Nevada, becoming a millionaire. Then he went to New York and continued to be successful in mining operations in Canada, notably the Sudbury nickel district and the Cobalt silver district. Recently he financed a large beet-sugar refinery in Utah. He died at 75, after having hit most of the high spots accessible to a man of his type. He worked hard and spent his money judiciously. He was discriminating in his choice of mines, avoiding those offering a narrow margin of profit. Where others were eager to secure possession of mining property, he bided his time. He had a commercial instinct alike in buying mines and in purchasing pictures. Although not averse from the chicane of a tricky business, he did not peddle stocks or promote companies as a means of unloading disappointing mines on the public; on the contrary, he dealt with others in 'the game' well able to protect themselves. Thus it became a contest of wits, in which he took an even chance. The Nipissing fiasco will be recalled as an example of his outwitting clever people, for in that affair he euchred the Guggenheims and their expert to a laughable degree. He was keen in keeping well-informed. For instance, he would read scores of local papers in order to get news of the latest discoveries in the West, and he was, we are told, a diligent reader of the Mining and Scientific Press. He was always ready to send a 'scout', one of his staff, to investigate any new find of ore. He was willing to face the risks of mining, and to depart from the beaten track. Thus, he erected a notable metallurgical plant at Mercur, introducing an early use of steel-concrete construction; and at Bully Hill he built an up-to-date copper plant, to which, when he found trouble in marketing his blister copper, he added his own refinery. He was a 'live' man, no mere cog in the machinery of life, but a driving-wheel. His code was not that of the Sunday-school but of the business arena, yet he lived up to his own code and made himself useful in his day and generation.

The Mooney Case

The fate of two bad men is engaging the attention of the public: William Hohenzollern and Thomas Mooney. It should cheapen the ex-kaiser in his own estimation to know that the question of his punishment divides interest with that of a social outlaw of the lowest type. On February 9, 1917, Mooney was found guilty of complicity in the outrage whereby ten persons—men, women, and children—were killed and fifty were wounded by the bursting of a bomb during the Preparedness Parade in San Francisco on July 22, 1916. A few weeks after Mooney had been sentenced, the principal witness for the prosecution, F. C. Oxman, was discredited by the publication of letters indicating that he had attempted to suborn another witness, F. E. Rigall, to commit perjury. Although Oxman was acquitted of the charge, his own testimony became suspect. That of several other witnesses suffered in later proceedings before the same Court against other defendants arraigned for the same crime. The Mooney case became the subject of public controversy, thanks to propaganda attempting to link his name with the labor movement and the taking of sides by the newspapers of San Francisco. The notoriety given to the case, in this country and abroad, induced President Wilson to appoint a commission of inquiry, headed by Mr. Felix Frankfurter, of the War Department, and assisted, among others, by Mr. W. B. Wilson, the Secretary of Labor. This commission issued its report on January 26, 1918, unanimously recommending a new trial, while refraining from expressing any opinion as to Mooney's guilt. In this report mention is made of "an attitude of passion stimulated by all the arts of modern journalism," the reference being to the shameless efforts of a San Francisco paper to exploit the affair by all the tricks of irresponsible sensationalism. On March 1, 1918, the Supreme Court of California affirmed the judgment of the lower court, denying a new trial. On July 27 the Governor of California, Mr. William D. Stephens, reprieved Mooney pending an appeal to the Supreme Court of the United States, which, on November 18, refused to review the case. On November 28 the Governor commuted the sentence of death to imprisonment for life on account of new evidence not in the trial record. In doing so, he made public two telegrams from the President, dated March 27 and June 4, this year, in both of which a request was made to commute the sentence on the ground of international sentiment. It is, of course, most unusual for the President of the United States to interfere in the administration of justice in a State, but the circumstances were unusual. Owing to the partisan

feeling aroused among the labor-unions the fate of Mooney had become an issue as between labor and capital. This phase of the affair had been purposely exaggerated by his supporters, so that it had been made to appear to the Socialists and Labor elements in Russia, for example, and also in England and France, that Mooney was the victim of a miscarriage of justice contrived by the plutocracy of San Francisco. In consequence of the success of world-wide propaganda in arousing class prejudice, the Mooney case had become a test of democratic institutions. At this time President Wilson was standing before the world as the spokesman of democracy and as the proponent of the humanitarian spirit evoked by the horrors of war, therefore it was awkward for him to be subjected to the jibes of Russian agitators, who had left the United States to foment Bolshevism, when they pointed at Mooney as the victim of capitalistic tyranny. Hence his anxiety to quiet the scandal, if possible. It is a scandal, of course; it exposes a defective judicial system, vitiated at its source by reason of popular election to office of those charged with the enforcement of law; it is another example of the injury done to a democratic commonwealth by the feud between the activities of the predatory phases of labor and capital in an industrial community. Mooney's real name is not known definitely, his mother is Irish, his wife is an Austrian Jewess, and there is reason to believe that Mooney himself is a Russian Jew on his father's side; nominally he is an iron moulder; actually he is a member of half a dozen anarchistic organizations, including the I. W. W. and the Allgemeiner Arbeiter-Bildungs-Verein; he was secretary of the International Workers' Defense League, an I. W. W. organization; on July 14, 1916, he incited a strike against the United Railroads, a company controlling one of the street-car systems of San Francisco; on that day he led a wild attempt to seize the street-cars by force. This connects Mooney with the long-drawn vendetta between the United Railroads and the labor-unions. At the head of the Preparedness Parade rode Mr. Thornwell Mullally, chief assistant to the president of the United Railroads. The unions looked upon the parade as an open-shop demonstration. Only twelve days previously the San Francisco Chamber of Commerce had called a meeting "to stamp out the disease" of unionism, and a million dollars had been subscribed to prevent the unions from throttling industry in this city. Immediately after the bomb outrage, Martin Swanson, a detective in the employ of the United Railroads and Pacific Gas & Electric companies, took charge of the investigation, gathering the bulk of the testimony against Mooney. The capitalistic class seized on the case as a chance to fasten discredit upon the cause of labor. The District Attorney, Charles M. Fickert, who prosecuted Mooney, was considered by the labor party, and by others less prejudiced, to be the tool of the public service corporations of San Francisco, and his conduct in office has indicated subservience to sinister influences. Thus the Mooney case appears as a sequel to the Schmitz-Ruef scandals that rocked San Francisco after the earthquake-fire in 1906. It is true, the reform movement of those days dealt with the corruption of City officials by the public service corporations, but the supervisors had been elected on a Labor ticket and most of them were union men. Then corrupt labor had conspired with corrupt capitalism; now they were at war over the Mooney case. This view of the affair is confirmed by the report of J. B. Densmore, published on November 22. Mr. Densmore is described as director general of the U. S. Employment Service, an annex of the Department of Labor. The report contained a dictagraph record of telephone conversations in the office of the District Attorney and constituted a lurid revelation of the illicit relations between the law and the tenderloin, between the police courts and the underworld. In this report it is stated that "there is nothing about the cases [of Mooney and others] to produce a feeling of confidence that the dignity and majesty of the law have been upheld." To speak of either 'dignity' or 'majesty' in connection with Mr. Fickert and his antics is a satire, but the same may be said of Mr. Densmore and his report, which is flagrantly unfair and bitterly partisan; it reads as if prepared for the purpose of discrediting everybody connected with the prosecution of Mooney. It throws little light on the case itself. Not the least remarkable feature of this investigation into Mr. Fickert's activities is the fact that it emanates not from the Department of Justice but from the Department of Labor. It looks like an official effort to suggest that the cause of labor is involved in the fate of Mooney, although the President's commission of inquiry had stated that Mooney "has not been identified with the labor movement" but "with a small group of agitators of pronounced anarchistic tendencies." Thus the issue has been further beclouded. Evidently at the present time not Mooney but the District Attorney and the Courts of Justice are on trial, and this regrettable result is not mitigated by the fact that Mooney is known to be a vicious anarchist. It has been said by utterly irresponsible people, that "he ought to be hanged whether guilty or not." To say so is to slap justice in the face and to make a stab at the heart of Democracy. Mooney was under trial for a particular crime; if not guilty of it he should be set free, no matter how black his previous record. On the whole, we would say that, recognizing the doubt of Mooney's guilt that has been created in the minds of men throughout the world, the Governor was wise in commuting the sentence; it were better for ten guilty men to escape punishment than for confidence in the courts of law to be undermined. One word more: on the spot where the bomb was thrown there has been built a twelve-story office-building for the Southern Pacific Railway company; this handsome building covers the area of a block, yet it has been occupied for a year; in other words, a great crime has gone unexpiated for a period more than twice as long as the time required to erect a magnificent building on the spot where the crime was committed. Is it better to build rapidly or to do justice swiftly? What is all our material advancement worth if the law is disgraced and democracy dishonored?

The Government and the Miners

By COURTENAY DE KALB

No more sudden *volte face* could be imagined than that which the Government has made within the last two weeks. It affects the metal industries profoundly. As for the manufacturing enterprises of the country, it may be said that they are absolutely at sea. It is a marvelous example of the inherent good sense of the people that a financial panic has not occurred. The stability of the market, for in fact it has been remarkably firm in view of what has happened, may prove to be due to the powerful influence of a few patriotic men who are in a position to control the industrial and stock operations of the country. Without some such stabilizing influence it is inconceivable that a collapse should not have followed the Presidential message, in which he told the business men of the country to look out for themselves, as the Government had no intention of sustaining industry during its transition from a condition of war to one of peace. The President was highly complimentary toward the business men, as he had good cause to be, and he expressed his admiration over the rapidity with which "the process of return to a peace footing has moved in the three weeks since the fighting stopped." He added that "It promises to outrun any inquiry that may be instituted and any aid that may be offered. It will not be easy to direct it any better than it will direct itself. The American business man is of quick initiative." This is very pretty, and it is also not without a touch of humor. Immediately after the signing of the armistice the heads of the War Boards told the country of the plan of the benevolent Government to sustain all industry by a continuance of the policy of price-fixing, by cancelling contracts slowly in order that neither the manufacturers nor the laborers should suffer, by letting down gradually from the high-pressure of war for the purpose of giving the steel and other great industries an opportunity to survey the industrial field and to book orders at home and abroad. It was said that six months at least would be required to effect the transition safely, and during that period the War Industries Board in particular was to be converted into an industrial clearing-house. Instead of that the War Industries Board, Mr. Bernard M. Baruch, his heads of sub-committees, including the notable person who has been running the Ferro-Alloys sub-committee so industriously in the interest of certain consumers of chrome and manganese, are clearing out altogether. The big barn in which the War Industries Board has been housed will be empty and silent after the middle of this month. The steel-makers who were hoping for fixed prices until July have been disappointed. Some of them are threatening to boost the prices, perhaps by way of retaliation upon Mr. John Skelton Williams, who has refused so far to make out a statement of his requirements in steel rails and rolling-stock for the national railways. As the watch-dog of the Treasury he refuses to waste the people's money; he must have high authority for paying large prices for the supplies that he contracts as the purchasing agent for the Railroad Administration. When he believes that the steel companies are making more than $20 per ton on rails at the present time he feels it to be his duty to wait until the steel manufacturers indicate greater humility by a reduction of prices. The steel men, on the other hand, declare that they are not making much profit at the prevailing prices, and that in some cases they actually would lose money by accepting orders at the old fixed price. The net result was to plunge the business world into gloom until the President addressed Congress on December 2. Then the sun came out. The President called the business men good fellows and advised them to go home and grow fat and happy by their own "quick initiative." As regards other points, of a political nature, the President has successfully used language to conceal thought, but in regard to business the message was definite and absolute. There is to be no industrial clearing-house. Whether a moral responsibility existed with regard to sustaining business is a moot point. Wide dissatisfaction exists, and many men claim that it means destruction for their enterprises. Mr. Hugh W. Sanford, who affected to take a broad statesmanlike attitude toward these national questions, when he labored to show why the chrome miners were not entitled to Government aid, used to point to the uncountable claims from other branches of industry that would swoop upon Congress if a precedent were established by the utilization of the War Minerals Bill in their behalf. The fact is that injury has been done to many private interests, and more injury will follow during the change to a condition of peace. The 'calamity howl' is inevitable, and the claimants for damages will buzz like a swarm of bees around the Capitol for months to come. The last of it will not be heard for years. This will happen, and was certain to happen, without any reference to the use of the War Minerals Bill. That measure, in fact, has nothing to do with readjustment; it was passed by Congress for two reasons, as transpired at a meeting of interested parties in the office of Secretary Lane on November 27. The first reason, as was made clear by the Secretary, and substantiated by congressmen present, was that the consumers were thrown into a panic when they saw that an immediate shortage of shipping was created by our entry into the War. In consequence they beseiged the Government for allotment of ships to bring in certain of the minerals mentioned in the Bill. Realizing that military needs were paramount, and that allotment of ships was not possible, they urged the utmost haste to develop the

domestic resources of these minerals, which were shown by the Geological Survey to be abundant. It was because of the insistence of the consumers, who had to have these substances for filling their contracts with the Government, that the War Boards and the Interior Department sent out its petitions to the people to make haste to produce these materials. The purpose of the Bill was further demonstrated by a notable letter issued by the Shipping Board on May 4, 1918, in which the people were begged not to wait until the Government had completed its plans for their protection, but giving them assurance that such necessary protection would be accorded in time. The letter is so important that it seems advisable to reproduce it in full. This was sent out by the Committee on Mineral Imports and Exports appointed under authority of the Board.

"The shipping situation requires immediate important changes in mining and allied industries. The precise nature of these changes and the agencies and methods through which they will be accomplished are not yet formulated, but there are certain fundamental facts which should be clearly understood. The acute ship-shortage has forced a drastic cut in imports of a considerable number of minerals essential to war industries. Among the more important embargoes of these are manganese, chromite, pyrite, and graphite. Some are already in effect. Others will soon follow. Ships released in this way, or their equivalents, have gone directly into military use, and with a still greater military program planned, and probable further decrease in total ship-tonnage, for a time at least, there is little possibility of early re-instatement of ships for mineral imports. The deficiencies in supply thus caused must be made up from domestic sources. Reduction of imports has been based on careful estimates of the possibilities of domestic production. Estimates have been liberal, and there is not much danger of over-production. Every ton mined here will save a ton of material that otherwise would have to be imported. The increased use of local ores will require many changes in practice and probably also reduction of less essential uses. Those changes must be accomplished, regardless of cost or difficulties, for the alternative of bringing in supplementary supplies from abroad no longer exists. Government co-operation will be necessary along several lines. Already attention is being directed to various phases of the problem by the War Industries Board, the War Trade Board, the Shipping Board, the Department of the Interior, the Railway and Coal Administrations, and the Treasury Department. There is pending in Congress a bill to concentrate control over the mineral industries most affected by ship embargoes. While the situation is being actively followed up there is likely to be a delay of at least several months before it is well in hand. If private interests wait until every detail is settled before taking steps to meet the situation there is danger of vital damage to essential war industries. Patriotism requires that the mining and metal industries do everything reasonably possible to get projects started at once. The necessary Government co-operation may be slow and halting, and mistakes are not unlikely, but as the shipping situation allows no alternative, it is a reasonably safe assumption that the absolutely necessary things will be done in time. In view of these facts far-sighted management of the mineral industry will not base its calculations for the immediate future on the practice of last year."

The object of the War Minerals Bill is clearly revealed in this important official document. It was to make good to those who trusted their Government, and who did not wait until the details of the bill were settled. It was in effect a sort of blanket contract with any and all miners that could and would produce without waiting to play absolutely safe. It is because of such a definite engagement on the part of the Government that the Secretary of the Interior, despite the advice given against the possibility of using the Act after the armistice had been signed, has been halting and considering, and, so far as the indications of occasional utterances go, is still hoping for a clear word that may seem mandatory from the people and their spokesmen in Congress, to go ahead fearlessly and stand on the technical terms which admit of applying the measure until peace has been proclaimed officially. Nothing that Secretary Lane could do would so widen his popularity and so strengthen the Administration as the recognition of the Government's responsibilty under this Act, by putting the machinery of the Act into operation as fearlessly as Postmaster Burleson exercised his technical statutory power to take over the cables for which the President felt it necessary to apologize in his message the other day. That was for purposes the virtue of which is debatable, to say the least; the use of the Minerals Act would be to carry out the solemn engagement of the Government toward those who responded to its appeal at a moment of need. The question of moral responsibility is one that will not be passed over lightly. Secretary Baker has given evidence of his feeling in these matters by directing that legislation be initiated to provide for a large list of contractors who had made arrangements in the heat of warlike preparation for supplies by accepting offers tendered by Government officials over the telephone. In ordinary business such orders are universally held to be valid, and no house would dare to repudiate orders so placed without sacrifice of its reputation for honorable dealing. On a technical point the Comptroller of the Treasury denied his ability to recognize contracts of this kind. The Secretary has said, "I have not had an opportunity to study the Comptroller's decision, but I understand from Mr. Crowell that it is very embarrassing. I have accordingly asked Mr. Crowell to prepare a draft of appropriate legislation to present to Congress to enable us to meet our ethical obligations."

It has been proposed that the difficulties with regard to using the War Minerals Act, which some persons profess to see, might be swept aside by introducing an amendment to the Act, and an amendment has been drawn for that purpose. It was also intended to institute an investigation into the status of the chrome miners, but

no action in this direction has been taken. The cause of the delay lies in the wording of section five under the Act, which provides a sum of $500,000 to be available until June 30, 1919, "for the payment of all administrative expenses under this Act." The President some time ago ordered that $100,000 out of this special appropriation be placed to the credit of the Department of the Interior, and steps were taken at that time to use part of the fund, so provided, for investigations for the benefit of potash, arsenic, and zircon production. Whether any of the money was spent for these purposes does not appear, but the amount has not been considerable in any event. When it was proposed last week to draw upon this fund for a preliminary investigation of the chrome miners, action was halted by Mr. J. E. Spurr, on the very proper ground that such an investigation was not in reality an "administrative expense", since the Act was not being administered. An amendment introduced as an Administration measure, and then held up in committee pending an investigation, which would take months to complete, would result merely in ruining the chrome miners by delay. It would take an entirely different sort of legislation to remedy their case unless prompt action be taken, and the only way to achieve that is by the use of the War Minerals Act. Mr. Baruch reiterated, as late as December 4, that he could not see why there should be any hesitation in using that Act to relieve the war-mineral miners, and that it was clearly applicable. Indirectly the chrome miners have suffered because the Act was not turned over sooner to the Interior Department. It is freely said that Mr. Baruch contemplated holding the administration of the Act in his hands if possible. It is also declared that he urged the President to hand it over to Secretary Lane at the last moment because he would not be able to employ it for the purposes of the War Industries Board, and that (to use the rude language of the street) he 'passed the buck' to Secretary Lane. This is gossip, and the objects sought by different bureaus inevitably lead to situations that give rise to gossip. The facts seem to be that both Mr. Baruch and Mr. Lane are sincere, and that they both desire to apply the War Minerals Act for the relief of the suffering miners. Mr. Baruch's work is ending, and that makes Mr. Lane the natural legatee of the Act. He has affirmed his own sense of responsibilty in the case, and has stated that the people should not be left in a position to say that their Government had not kept faith with them. On the other side his advisers have not supported him with recommendations to employ the Act. The Bureau of Mines prepared a draft of articles of incorporation for a potash corporation under the Act, and suggested that $5,000,000 be placed to the credit of the Corporation to take care of the potash industry. This recommendation has not been acted upon by Secretary Lane, and it is evident that he would prefer not to act upon one of the minerals without taking care of all those who are as clearly entitled to protection. The shade of difference between the situation of the potash and the chrome producers is too fine to appeal to practical men. The Act requires that in the case of each mineral procedure shall be taken on the determination that there exists a present or a prospective shortage of supply. The stocks of chrome are excessive at the present time on account of importations, made largely in defiance of Government embargoes, and without license. Adherence to the rulings of the Government that was protecting the consumers would at the same time have protected the producers who went into the industry because the consumers had asked the Government to encourage domestic production. Therefore there is only a prospective shortage of the domestic supply of chrome, to which kind of shortage manifestly the Act referred. In the case of potash there is no overstocked market; the consumers are not buying the stocks in the producers' hands because they expect to be able to buy their needed supplies more cheaply from Germany. Therefore there is no prospective shortage of potash, although there would be a shortage of domestic supply if the Act were so administered as to keep out shipments from abroad. Here the argument is the same as in the matter of the chrome producers; the declaration of shortage must be made in view of a shortage of domestic supply except this Act be used for stimulative purposes. This is so plain that the Secretary of the Interior has not proceeded to carry out the recommendations of the Bureau of Mines regarding potash.

Apparently the real deterrent to immediate action for the benefit of war-minerals producers is the possibility of hostile criticism concerning the expenditures by the Administration during the War. The cry of the Republicans is that the Democrats have been recklessly wasteful, while the great anxiety of the Democrats is to curtail expenditures in every direction and give no hook on which the opposing side may hang another indictment of 'extravagance'. Politics, therefore, have much to do with the halting policy of the Administration at this moment in regard to the war minerals. All that can be said now is that the question of action under the War Minerals measure is in abeyance, and that the support of many Senators and Congressmen of both parties is growing so that the Department of the Interior may not in the end hesitate to proceed under a broad construction of the Act, to carry out its deeper purposes which were to fulfil the obligation undertaken by the War Boards and Departments when they asked the miners not to wait, but to make haste and produce, trusting in the legislation then pending to make their efforts financially safe.

TUNGSTEN ORE exported from the Federated Malay States during 1917 amounted to 761 tons. In 1916 the total was 515 tons, and in 1913 only 225 tons. The ores were 60% wolfram and 40% scheelite.

CARBON is one of the most refractory materials known. It does not melt in the presence of the highest temperatures and volatilizes only in the electric arc, which has 3500°C. approximately.

The Chrome-Manganese Scandal

The American Mining Congress, by its Secretary, Mr. J. F. Callbreath, has issued the following circular under date of November 29.

Relief for those in distress as a result of failure to make effective the War Minerals Bill before the signing of the Armistice is more problematical than ever. As a suggestion of Chairman Baruch, of the War Industries Board, the President did not issue an executive order fixing administration of the bill until pressure was brought to bear and Mr. Baruch withdrew his objections agreeing that administration should be placed in the Interior Department. When, finally, the combined influences at work secured the executive order, its delivery was delayed and authority was not received by Secretary Lane until November 19.

A preliminary conference of officials of the departments interested, with a committee of the Pacific Chrome Producers Association and the American Mining Congress, was held on the 21st and it was agreed that the chrome problems should be the basis of any line of future action. A conference was at once called for (November 27) in the office of Secretary Lane, to which were invited the chiefs of the War Industries Board, the Shipping Board, the War Trade Board, the Bureau of Mines and its divisions, also the Pacific Coast Chrome Committee, and the American Mining Congress, the Committee on Mines of both houses of Congress, and the representatives of 22 users of chrome and manganese.

At the conference there were present several officials of the Government, including Secretary Lane and Director Manning, no senators—representatives Garland of Pennsylvania and Wingo of Arkansas. Other organizations as listed were represented and three chemical corporations representing 45% of chrome consumption.

A clear statement of the case was presented. It developed that consumers have on hand a full year's supply in addition to ore in bond or at the mine. No steel companies being present and the chemical manufacturers refusing to participate in any arrangement for purchasing ore now produced or ore blocked out, Secretary Lane closed the meeting without bringing out a single constructive suggestion.

The consensus of opinion was expressed by Mr. Vance McCormick, of the War Trade Board, who said, "There is no question about the Government having assumed a moral obligation" . . . though he offered no suggestion for relief. Several cases of acute personal distress among both chrome and manganese producers who had been induced to make heavy investments through the Government's appeal, were placed before the conference.

There appears little hope for general relief under the War Minerals Bill, but Secretary Lane, and Director Manning, of the Bureau of Mines, have ordered an immediate and complete investigation of all minerals included in the bill in order that exact data may be assembled upon which to make the bill effective as to future conditions and production.

In order that there can be carefully planned and completely operative machinery for pushing relief measures: The American Mining Congress hereby calls a conference of producers of manganese, chrome, tungsten, and pyrite, in Washington, D. C., on December 16 and 17 for the purpose of acquainting the Administration with all facts, presenting and considering plans for relief legislation and organizing the campaign of education necessary to success. Concrete unquestionable proofs will be necessary to back up the movement. The rights of all producers must be protected and the industries placed on a safe future basis. The American Mining Congress will co-operate in furnishing the evidence. Every producer should join this movement, furnish us at once with business statements—or—attend the conference, either personally or by representatives. We hold out no special promise of success except that as the Administration has openly admitted moral responsibility 'team' work from this time forward will probably bring results. Telegrams and letters from all producing States indicate that the industry is ready for united action.

Costs at the Tomboy, Colorado

During the year ended June 30, 1918, the Tomboy Gold Mines Co., operating at Telluride in the San Juan, was handicapped by a serious shortage of labor and a marked inefficiency on the part of the labor available. The mill treated 151,028 tons of ore. Costs of all departments were as under:

Mining and development	$2.51
Milling	0.70
Concentrate expense, including transport to rail	0.63
Water-supply	0.09
Assay-office	0.05
Cyaniding	0.91
General	0.33
Taxes and insurance	0.36
Total per ton	$5.58

Gold v. Silver. Principally because of the monetary uses they serve, gold and silver are placed among metals in a separate class, and are jointly referred to as 'precious metals'. But even between them there is a great difference in 'preciousness', which is not ordinarily appreciated. The contrast in their value is illustrated in the recent shipment from the assay office to India of $3,000,000 worth of the white metal. The consignment weighed about 103 short tons, and in a solid mass had a bulk of 316 cu. ft. On the other hand, a lot of gold of equal value will tip the scales at a little under five short tons, and occupy a space of only 8½ cubic feet.

Iron ore has been reported to exist in 54 out of 58 counties in California. Of 159 different localities it is considered that 14 deposits may in time be of considerable commercial importance. All the known ores of iron are represented, the magnetic ore predominating. So far as chemical analysis has yet shown the ores compare favorably with those of any other region, some of them being of distinguished purity.

The Leaching Plant

By T. A. RICKARD

The ore to be leached is the oxidized cap that is stripped from above the main mass of sulphide ore. It averages 0.65% copper in the form of the carbonates, malachite and azurite, with a minute proportion of the silicate (chrysocolla), and contains an additional amount of copper, 0.1 to 0.2%, in the form of chalcopyrite and chalcocite. The principle underlying the metallurgical process is borrowed from nature, for sulphuric acid, derived from the decomposition of sulphide mineral, is used to dissolve the copper, which is then precipitated upon scrap-iron. The plant has a capacity of 2000 tons of ore per day.

The railroad-cars, containing 64 dry tons each, are discharged over grizzlies made of I-beams covered with a mushroom top of manganese-steel. Pieces of ore too large for the openings, which are nine inches wide, are broken with sledge-hammers. The ore then falls on a second set of grizzley-bars, three inches apart, the oversize going to steel bins that discharge upon steel caterpillar-apron feeders delivering to 5-ft. Stevens-Adamson pan-conveyors, by which it is discharged to screens, with one-inch openings, ahead of two gyratory crushers, No. 6 Gates, style K. From these crushers the ore passes to a belt-conveyor leading to a sizing-screen, inclined at 45°, and made of $\frac{5}{8}$-in. wire with 1-in. openings. The oversize from the screen goes to Garfield rolls, 72 by 20 in., while the undersize passes direct to a hopper discharging upon the belt-conveyor that feeds the vats. The undersize from the 3-in. grizzley passes to another sizing-screen, similar to the one already described, from which the undersize falls upon the hopper discharging upon the belt-conveyor feeding the leaching-vats, while the oversize joins the crusher product on the conveyor ahead of the primary rolls. The product from these rolls is conveyed to a screen ahead of the secondary rolls, the oversize being returned by a conveyor after passing through the secondary rolls to the screen ahead of the primary rolls, while the undersize is delivered to the vats. The belt-conveyor carrying all the crushed ore discharges upon a 4-ft. pan-conveyor provided with a transverse slot through which one part in 400 is removed as a head sample. This pan-conveyor delivers to a hopper that feeds a 42-in. rubber-belt conveyor discharging by means of a tripper traveling with a loading-bridge equipped with a Robins tripper-conveyor, discharging into and filling the leaching-vats. The product from the crushing department shows about 10% coarser than half an inch, more than 40% coarser than 3-mesh, and only 20% finer than 20-mesh. About 39% of the copper rests with the material between $\frac{1}{2}$-inch size and 4-mesh. Evidently this is the critical point in the crushing; 58% of the weight of the ore containing 48% of the copper in the ore has been separated at this stage. A typical screen-analysis is given herewith:

Screen-Analysis

Assay of tank No. 9 heading; October 2, 1918; run No. 87

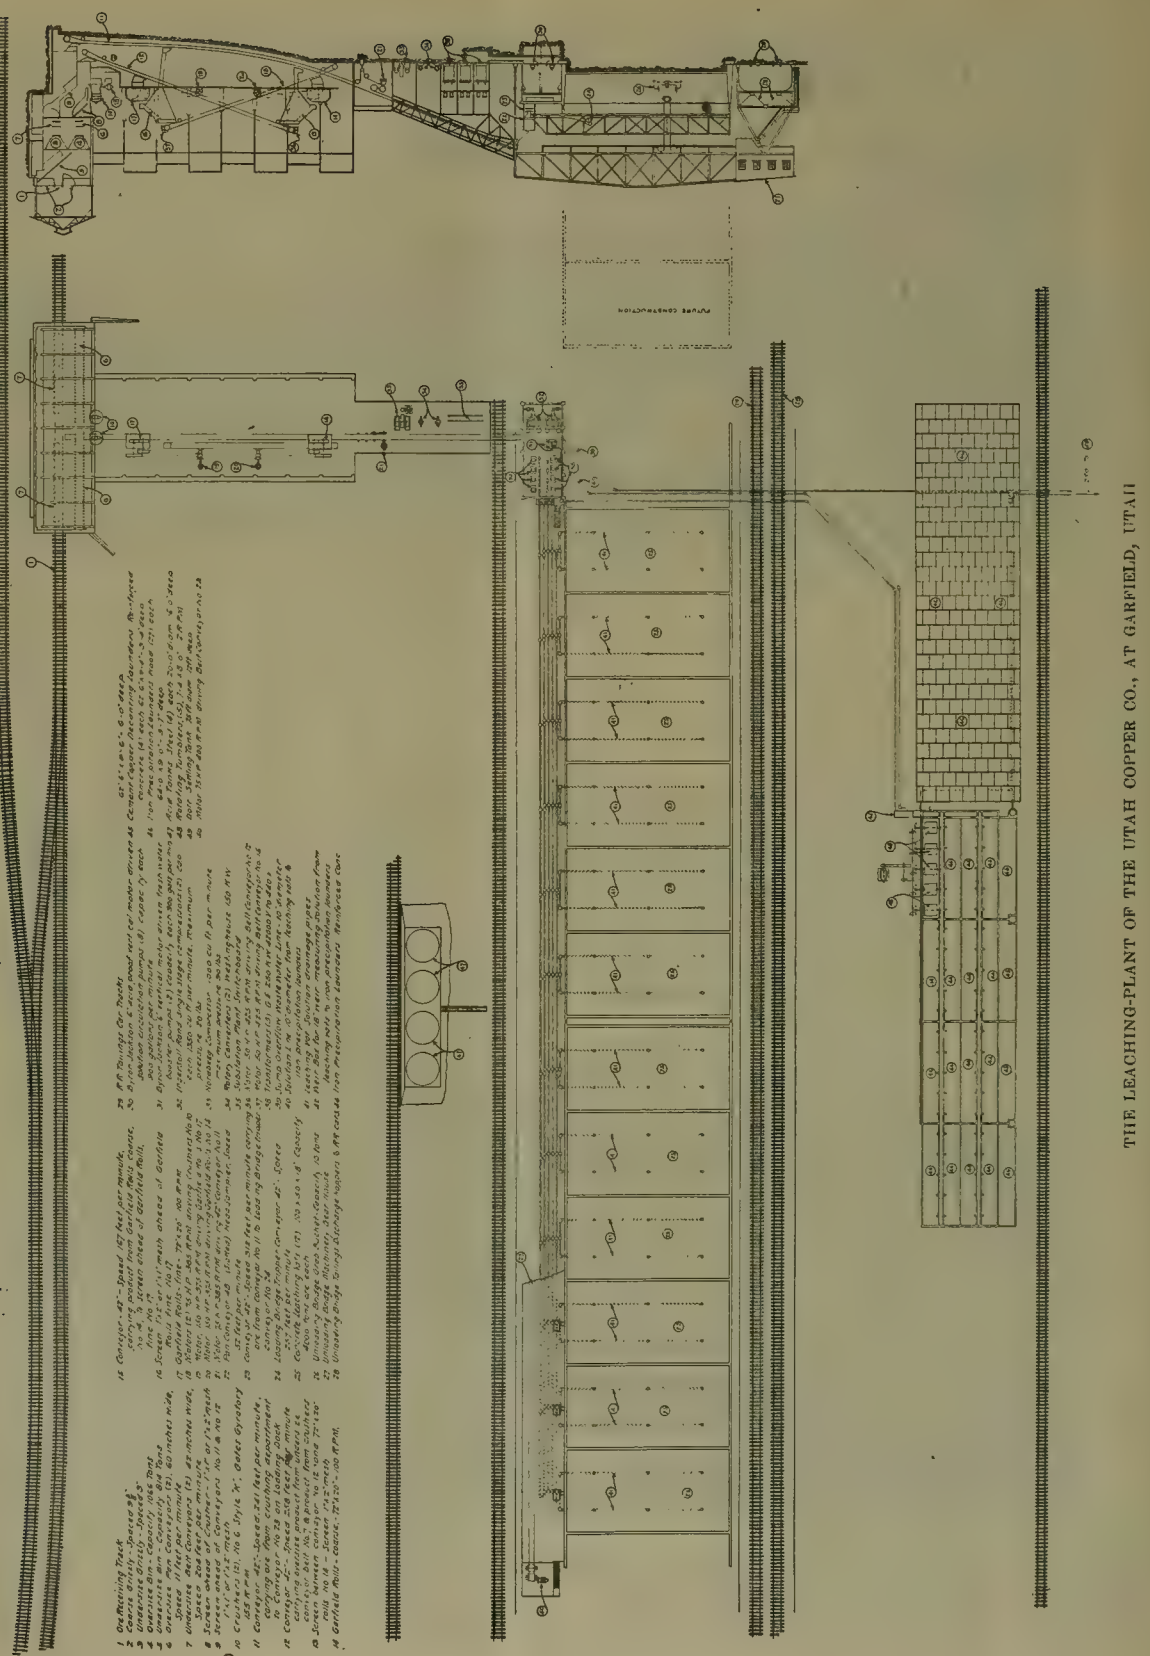
The 12 leaching-vats are 100 ft. long, 50 ft. wide, and 17½ ft. deep. They are arranged in two contiguous groups of six each, so as to neutralize the expansion. They are made of concrete, heavily reinforced. The walls are lined with mastic, a mixture of

	%
Trinidad asphalt	25
Sarco putty No. 4	4
Gilsonite	4
Cement	5
Sand (minus ¼)	67

The mastic is 1½ in. thick and is reinforced with 2 by 2 by 0.162 in. diam. crimped wire. The floors of the vats are coated with mastic half an inch thick. Upon this floor come 6 by 6 in. stringers, spaced 10 in. apart, laid lengthwise of the vat. The stringers are 9 ft. 6 in. long; their ends are beveled 3 in., and they are 3 in. apart. Across them are placed wooden stringers 2 by 8 in. and $\frac{5}{16}$ in. apart. On these is spread cocoa-matting ¼ in. thick; then more 2 by 8 pieces, $\frac{5}{16}$ in. apart, so that the two-by-eights lie across each other, separated by the mat.

Ample pumping-plant capacity has been provided for the transfer of the solution as required. The intention is to resort to a cyclic advance of solution. All the valves are of the disc-and-gate type, lined with lead, whereas the pipes are made of redwood staves that have been immersed in paraffine, wound with hard-drawn copper wire. When received from the Redwood Manufacturers



THE LEACHING-PLANT OF THE UTAH COPPER CO., AT GARFIELD, UTAH

Co. they are immersed in hot asphaltum paint. The cast-iron fittings and connections are lined with mastic. The mastic mixtures used for different purposes are as follows:

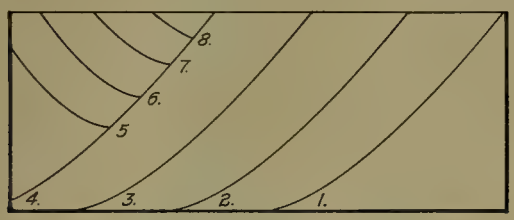
•Drv. †Damp.

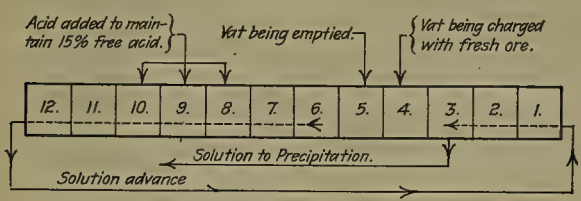
When charging, the tripper-conveyor drops the ore at one side of the vat and continues to feed on the same side until the toe of the slope reaches the opposite side; then the filling recommences from this opposite wall into the V-shaped space that has been left by the preceding operation. This is the method adopted at Chuquicamata.



METHOD OF FILLING THE TANKS

The idea is that the coarser particles of ore run to the bottom of the vat; if the filling were to advance continuously from one side, the coarse ore would extend up the opposite side, producing conditions unsuitable for the uniform percolation of the acid solution.

Fresh ore is fed into the vats in sequence, the freshest ore being subjected to the oldest solution, that is, the one containing the most copper and the least free acid. At the time of my visit, No. 5 vat was being emptied of its tailing, while No. 4 was being filled with fresh ore. The last stage of solution was taking place in No. 6, thus:



CYCLE OF LEACHING

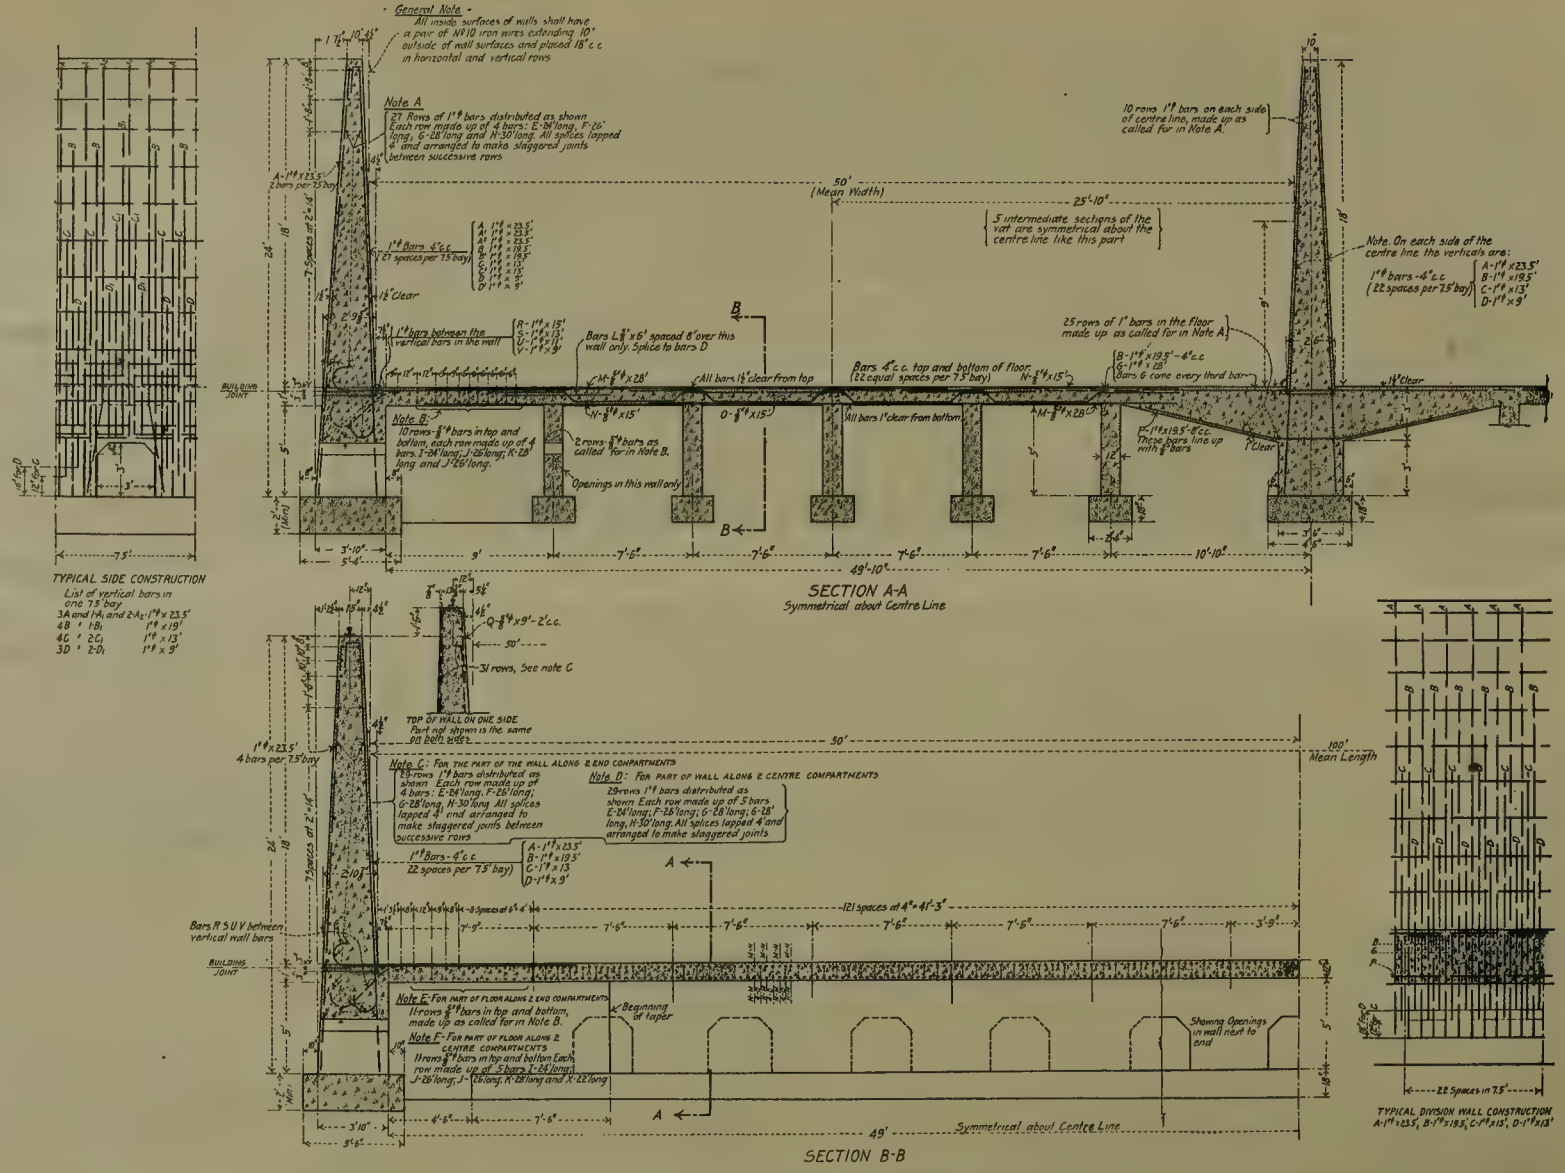
The solution is advanced at the rate of approximately 80 gallons per minute through the vats in series from 6 to 7-8-9-10-11-12-1-2-3. After all the solution in No. 6 has been advanced to No. 7, wash-water is added until the effluent from the tank contains from 0.08 to 0.15% copper. The wash-water advancing in the cycle is gradually enriched with free acid and copper, the first addition of acid having been made to a selected number of the vats, No. 8, 9, and 10, in the cycle. From this point no more acid is added, the free acid being gradually neutralized by dissolving the copper, iron, aluminum, etc., content in the ore until the solution on the newest ore, or that last charged into the leaching-vats, contains 3.16% copper, 0.37% iron as ferrous, 0.95% as ferric iron, and 0.24% free sulphuric acid. The intention is not to add acid at any stage in such measure as to cause the proportion at the close to exceed 0.2%. Thus, when the cycle of operations brings the solution to the fresh ore, the acidity is at its minimum and when the copper-bearing solution (the product of the leaching process) is drawn away from precipitation, it contains not more than 0.2% free acid. To express the idea in another way, the acidity, or strength of the active solution, is brought to a peak in the middle of the series of operations, so that when it is applied to the new ore and likewise when it is withdrawn, enriched by 2½% copper, it contains not more than 0.2% acid. The rich solution is drawn from the vat containing fresh ore, because, owing to the soluble components, it can neutralize the free acid quickest at this stage.

Ascending the stairway to the top level of the vats, I watched the solution (1.3% ferric, 0.3% ferrous iron, with 2% copper, and 2% free acid) being circulated by an air-lift after withdrawal from the bottom of the same vat, to induce circulation. The yellowish green liquor was covered with a creamy foam, except where clear patches appeared indigo-blue, owing to the reflection of a perfect sky. As one proceeds to the end of the cycle, the solution circulating in each successive vat gradually changes in color from a greenish-straw to a greenish-blue color until finally the solution circulating on the freshest (or newest) ore is of a fairly clear blue color.

The explanation of this variation in coloring is that the percentage of ferric phosphate present gradually decreases, owing to its precipitation in the ore, as the free sulphuric acid present is neutralized in the cyclic advance. The ore contains 0.2% phosphorus, which evidently first goes into solution, and is then precipitated, the greater portion being eventually discharged in the tailing. Until the presence of phosphorus was noticed, it was thought the precipitate of cement copper was contaminated with basic ferric sulphate by reason of atmospheric oxidation occurring in the scrap-iron precipitation launders. Apparently this contamination is due to the presence of basic ferric phosphate instead.

From No. 5 vat the residue (tailing), after leaching had been completed, was being removed by a Mead-Morrison excavator, which has a 10-ton grab-bucket, enabling 4000 tons to be removed in an eight-hour shift. The grab takes the tailing from the floor cleanly, planing any boards that rise above the general level. This excavator discharges into a hopper having a motor-controlled gate that empties into 45-ton Clark air-dump cars. The tailing shows only a trace of soluble copper, the greater loss being in undissolved sulphide. It would not be fair to quote the exact assay, because operations are still in the experimental stage.

Acid is obtained from the Garfield Chemical Co., five miles distant and adjoining the Garfield Smelting Co.'s (A. S. & R. Co.) plant. Fresh acid is added in the middle



General Note.
All inside surfaces of walls shall have a pair of №10 iron wires extending 10" outside of wall surfaces and placed 18" c c in horizontal and vertical rows
Note A
27 Rows of 1" bars, distributed as shown. Each row made up of 4 bars: E-24' long, F-26' long, G-28' long and H-30' long. All splices lapped 4' and arranged to make staggered joints between successive rows
10 rows 1" bars on each side of centre line, made up as called for in Note A.

SECTIONS SHOWING THE CONSTRUCTION OF THE LEACHING-VATS

of the leaching advance. Very little (0.06 to 0.09%) ferric sulphate passes from the precipitation vats. All of this solution is wasted. The specific gravity and assay of the solution in cycle is as follows:

	Specific gravity	Free acid %	Copper %	Iron—Ferrous %	Iron—Ferric %
To precipitation	1.1390	0.24	3.16	0.37	0.95
In centre of cycle	1.1880	1.24	2.58	0.20	0.75
At end of cycle	1.1100	1.23	1.83	0.18	0.68
Last wash-water before tailing		...	0.089	...	...

The copper-bearing solution flows through wooden-stave pipes of 10 in. diameter to the precipitation vats. The first series consists of four rows of four mastic-lined vats, each 9½ by 62½ ft. and 6 ft. deep, made of reinforced concrete, the walls being 6 to 10 in. thick, with a suitable batter. The flow of the solution continues up and down the total length of 1000 ft. In the second series likewise, the flow is continuous through 27 wooden vats, 9 by 64 ft. each, and 3 ft. 7 in. deep, a total length of 1728 feet.

In the first vat (62½ by 9½ ft.) of the first series are five barrels, 7 ft. 4 in. diam. and 8 ft. long, which are turned at the rate of two revolutions per minute. One of these is made of maple and four are made of fir. The wooden staves (4 by 8 in.) of the barrels are perforated with ⅝-in. holes placed 8 in. apart, permitting the solution to enter. The barrels are loaded with tin-cans and other small scrap-iron, which, as it becomes corroded by the solution and replaced by the copper, disintegrates. When small enough, the particles of iron, with the cement copper, escape from the barrel through the perforations into the vat. These products of the process are discharged by pulling a wooden plug in the bottom of the vat, from which the thin mud of cement copper and iron runs over a screen of ½ in. openings by which the coarser particles of undissolved iron are held. The same screen is used to clean up the residue from the other vats, and it serves to catch any leaf or plate copper that might interfere with the accurate sampling of the 'cement', or copper mud. All the vats, except the first, are filled with scrap, the heavier pieces being placed in the concrete vats and the lighter ones in the wooden vats. When cleaning up, the solution is withdrawn through a hole in the bottom, and a hose is played on the scrap so that the water removes the cement, which runs into one of the four settling-vats covered with a screen. The wash-water is decanted and the copper precipitate is removed by a clam-shell excavator into cars that transport it to the drying-vats. The decanted water flows into another vat, 75 ft. diam. and 12 ft. deep, where any remaining particles of copper settle. To this vat comes the waste solution from the entire series of vats, in order to arrest any copper that otherwise would be lost.

At the south end of the leaching-vats are three shallow wooden vats, 65 by 70 ft., full of red clay apparently. That is the cement copper undergoing atmospheric drying, or evaporation of its excess water. The method seems ill-adapted to winter or to the rainy season. The yellowish green slime of basic ferric phosphate discolors the copper. The solution coming to the precipitation vats from the leaching-vats is vividly bluish-green, the color of copper sulphate mixed with ferrous and ferric sulphates.

The precipitation plant looks like a junk-store in chemical liquidation. One regrets that the scrap cannot be macerated or otherwise reduced to small and nearly uniform particles so as to expose a large surface to corrosion and precipitation. Sponge-iron is being tried for this purpose at Ajo successfully, but the use of it depends upon the cost of production.

The accompanying photographs illustrate the various stages of the metallurgic operation.

The Elko Prince Mine, Nevada

By J. V. N. DORR and L. D. DOUGAN

*The Elko Prince mine is in the Gold Circle district, Nevada, 1½ miles from Midas, 55 miles west of Battle Mountain, and 50 miles north-east of Golconda.

The geological structure of the region is simple. The oldest exposed formation, covering most of the area, is rhyolite, which has a light-colored devitrified groundmass enclosing phenocrysts of feldspar, quartz, and magnetite. It has been somewhat weathered and partly stained with oxide of iron. There are several outcrops of andesite which cut the rhyolite. The ore deposits occur as fissure-veins, replacement veins, and sheeted zones. The Elko Prince vein is of the first type. The rhyolite near the veins is silicified, stained with oxide of iron, and, at some localities, replaced by ore, or is so permeated by metals as to be classed as ore. The vein filling consists chiefly of quartz, and the value consists entirely of gold and silver.

The following conditions influence the method of mining. The vein is almost vertical; its average width is 15 in., seldom less than 12 or more than 24 in. thick. The west wall is smooth, hard, and firm, with quartz sometimes 'frozen' to it; the east wall is less well defined, decomposition having extended into it to a depth of a few inches to two or three feet. A sliding movement has occurred in the east side of the vein, and at some points a considerable amount of gouge is found, containing pieces of vein matter. When planning a method of mining, stripping (resuing) was considered, the idea being to mine the east wall as narrow as possible, use it for filling, break the ore away from the west wall, and run it all out. The vein, however, was too brittle in many places to permit this; all of the quartz in the gouge would have been lost, as well as much of the vein proper. Stoping the ore with some waste, as little as possible, was a method that permitted the recovery of all of the ore, and it was thought that the increased milling expenses would be less than the loss by any selective method of mining. Overhead stoping was therefore adopted. The cost of mining in 1917 totaled $3.123 per ton, stoping accounting for 80.8c., timbering 55.9c., and powder 44.5c. per ton.

Topography and Geology of Dredging Areas—II

By CHARLES JANIN

*Dredging in the Yukon field, which is typical of other fields in the far North, is now being conducted on two classes of deposits: river-valley and creek-beds. Where thawed, the gravel in the valley of the Klondike river is well adapted for dredging. The gravel is free, rounded, and clean, and averages 30 to 40 ft. in depth. The bedrock is sufficiently decomposed to be dug with ease. The top burden in the thawed areas of gravel has been largely removed by stream action and presents little or no difficulty to dredging.†

The creek deposits are altogether different. They are shallow, the depths to bedrock mostly ranging about 18 to 20 ft. The gravel is angular and contains little sand, the gold is confined almost entirely to bedrock. The creek gravels are overlain with what is known locally as 'muck', a deposit containing organic matter, fine sand, and water, which is almost invariably frozen, and where undisturbed is covered with a blanket of moss. The depth of this muck is from 4 to 8 ft., averaging 6 ft. In dredging on the creeks it is necessary to take up 4 to 6 ft. of the bedrock, which is a massive and blocky sericite-schist. Operations in the Yukon district are subject to difficulties not met elsewhere except in Alaska. These difficulties are caused by the climate and the character of the deposits. The extreme cold of the Northern winter limits the open season to about six months. Dredging cannot begin until thawing has produced water enough to float the boats and to clear the ponds of winter ice, 5 to 7 ft. thick. Work at both the start and finish of the season is hindered by cold. All moving parts, such as the tailing-conveyor, must be housed and warmed with steam coils. Also steam must be used freely to keep the ladder and bucket-line clear and gold tables in proper condition. The dredging season ends when the creek freezes, so that there is not enough water for floating the boat.

The creek deposits present many obstacles to dredging. In the first place the deposits are shallow, necessitating

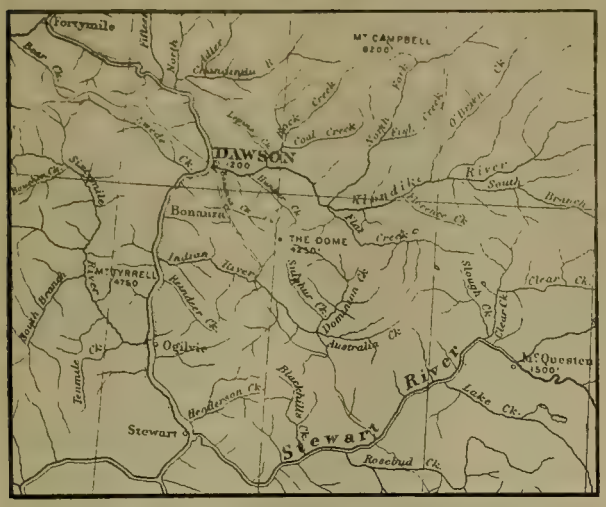
DREDGES OF CANADIAN KLONDYKE MINING CO., STARTING OPERATIONS ON MAY 12, 1913

frequent moving of the dredge, both 'stepping ahead' and across the pond. Also the shallow ground increases the labor for necessary outside work, such as setting 'deadmen' and removing stumps. The thawed muck is



MAP OF THE PRODUCTIVE AREA OF THE KLONDIKE

not difficult to handle, particularly if it is sandy, but it often contains buried stumps, roots, and other material, which tend to choke the feed-hoppers and cause delays. Digging the bedrock in order to recover the gold is the most difficult part of the process. It is slow hard work which entails heavy wear on the entire machine and necessitates continual replacement of all digging parts. Frozen ground is the greatest obstacle to dredging on a large proportion of the creeks, for the gravel must be thawed before dredging can go on successfully.

The short working season led to many departures from usual methods. Effort is concentrated on getting all that is possible out of the dredges, and the result is a remarkably high efficiency for the period of operation. Each season has shown a gain in yardage per dredge-hour over the season previous, until the present rate compares favorably with that of dredges of the same size in California, where conditions are much more favorable. This result is largely made possible by thorough overhauling and repair during the months of no dredging.

The accompanying photographs show some interesting operations by one of the big companies working near Dawson, on the Klondike. The locality of the first is known as Bonanza basin. Bonanza creek may be seen at the foot of the hill on the right-hand side of the picture, and the Klondike river on the left hand, crossed by the Ogilvie bridge, and flowing along the right limit of the valley bearing its name. About a half-mile downstream the river Yukon is reached, and the town of Dawson. In the next picture the large buildings in the foreground are the shops of the Yukon Gold Co., while the Bonanza Basin camp of the C. K. M. Co. is to be seen near the lower of the two dredges.

DREDGE OF CANADIAN KLONDYKE MINING CO. ON JULY 11, 1916, SHOWING GROUND MOVED IN THREE SEASONS

Manganese in 1918

American mines now supply nearly one-third of the high-grade manganese ore needed in this country; in 1917 they only supplied one-sixth. During the first six months of 1918, shipments of ore containing over 35% Mn were 136,554 tons; while in October the rate was 28,000 tons per month, or 336,000 tons per year. Total shipments of this ore for the whole of the current year are estimated at 324,000 tons, according to D. F. Hewitt, of the U. S. Geological Survey. During the half-year, 10 to 35% ore amounted to 314,137 tons; the estimate for the full year is 832,866 tons.

The number of shippers of all grades of ore appears to have reached a maximum in the last quarter of 1917, as the number then reporting was 195; whereas the number reporting during the first six months of 1918 was only 190. The producers reporting in 1917 included many small shippers, some of whom have combined, causing an actual reduction in number, yet increasing the aggregate output of the industry.

Montana, which stood first in the production of high-grade ore in 1917, continues to lead, and its leadership appears to be secure, as the Butte district is contributing almost as much high-grade ore as the Philipsburg district, and the two together, contributing nearly all the output of Montana, now produce more than ten times as much as is being produced in any other State. Butte has 5 and Philipsburg 18 shippers. Montana is now producing 20,000 to 22,000 tons of ore monthly. The electric-furnace plant recently put into operation at Great Falls for making ferro-manganese, will create a market for nearly 100,000 tons of ore annually, so that the production of manganese ore in Montana may continue to increase.

The shipments of ore from California for the first six months of 1918 were 10,601 tons, against 12,730 tons in the whole of the year 1917. The present rate of shipment is 2400 tons per month, and it is estimated that 22,000 tons will be shipped from the State in 1918. There are 31 shippers. The Livermore-Tesla district, in Alameda and San Joaquin counties, is the source of most of the ore shipped; but large shipments are regularly made from the Chocolate mountains, Imperial county, and from the Ironwood district, Riverside county.

The shipments from Nevada during the first six months of 1918 were 12,586 tons, and during the year they will probably be 27,000 tons. The maximum monthly rate—3500 tons—was reached in April, on account of the activity of the Three Kids mine, east of Las Vegas. There are 11 shippers.

Although the rate of shipment during recent months from Alabama, Arkansas, and Georgia is slightly higher than the rate in the early months of the year, the aggregate increase in the quantity of ore has not been great. Arkansas has 10 shippers. Shipments from other States, notably from Tennessee and Virginia, have been maintained at a uniform rate, but those from Utah have declined.

The shipments of ore from Minnesota were 305,641 tons from January to June, 1918, and reached a maximum rate of 130,000 tons in July. It is estimated that 950,000 tons will be shipped from the State during 1918. The ore shipped contained 5 to 20% Mn. Several new mines are expected to reach the producing stage in 1918, but their contributions for the year will be small.

Mines (eleven) in the Leadville district, Colorado, shipped 60,804 tons of low-grade ore in the first six months of 1918; and although the average rate of output was lower during July and August there is a fair prospect that 120,000 tons will be shipped during the year. The recent decline in shipments is evidently due to the increase of stocks in the hands of established consumers and to the producer's inability to extend the market, as the mines of this district could have supplied a much larger quantity of ore containing 20 to 35% Mn than was actually shipped.

Imports of manganese ore from all sources from January to June, 1918, as reported by the Bureau of Foreign and Domestic Commerce, were 244,836 tons, which, if added to the 136,554 tons of domestic ore produced, indicate a visible supply of 380,000 tons for the half of the year. Brazil supplied 171,895 tons; Cuba, 41,984 tons; India, 22,150 tons; while small quantities were imported from Chile, Costa Rica, United Kingdom, Panama, Mexico, Japan, Canada, and Australia. Imports in July were 29,886 tons, those in August 33,975 tons. From January to June, inclusive, 18,474 tons of ferro-manganese was received from Europe. In June the imports for the remainder of the year were restricted to 12,000 tons.

To summarize, it may be said that the extraordinary increase in the output of high-grade ore in 1918 has fully offset the loss occasioned by the restriction of imports made necessary by the shortage of ships and has established confidence in the capacity of the domestic deposits to supply a considerable part of domestic need. The imports of ore and alloy, and the domestic shipments combined, have recently exceeded the current needs and discouraged some consumers from further increasing their stocks. Plans are under way for further restricting the imports from Brazil, and it is hoped that the present rate of production will be maintained well into 1919, although operators should be cautious in undertaking new explorations.

SHEET-ZINC is in great demand since the beginning of the War for lining packing-cases made for shipment overseas, especially cases containing munitions or other material that is likely to be affected by salt air. The War Industries Board has ordered the use of sheet-zinc instead of galvanized iron or steel for refrigerator linings, which will require about 10,000 tons of rolled zinc. Sheet-zinc can also be substituted for galvanized iron in roofing, spouting, guttering, garages, household utensils, and hospital ware.

DIAMOND-DRILLING in porphyry presents numerous difficulties, according to Cecil Fitch, of Eureka, Utah.

Monetary Adjustments and Gold Mining

By BLAMEY STEVENS

The Relative Importance of Gold. To appreciate an adverse condition that needs a remedy we must go to the roots of it. The world's total production of gold for several years past has averaged 450 million dollars per annum, about half coming from South Africa and a fifth from the United States. Large as these figures seem, gold mining is really only a small branch of the industrial tree. The War cost the world about one hundred times as much wealth as gold mining ever produced in any similar period, and this does not include all the other industries that were carried on to supply the current needs of the populace, while the War was on, industries amounting in the aggregate to probably three or four times as much again as the cost of the War. Although the gold miner will be loath to take this perspective of it, the world can do without gold very much better than it can do without wheat, or iron, or copper, or corn, or a dozen of other commodities.

Gold as a Monetary Standard. Before the War we used to talk of stabilizing monetary standards by using gold not only as a basis of value, but also as a guarantee of value, resting assured that gold in quantity was necessary to back currency, and also, by its free flow from one country to another, to correct effectually the standard exchanges between these countries. The War, however, has told us that this was a theory based on special conditions, and we see Great Britain holding a fairly stable standard of American exchange with only minor metallic reserves or commodity gold to use for international adjustments.

Gold as a Convenient Commodity. We may henceforth look on gold simply as a convenience, and the lack of it as an inconvenience, not a condition of monetary famine. When before the War there were more orders received by the banks of one country from another country, for payments, than could be balanced off in return orders, the exchange or ratio of monetary standards varied, and a flow of gold was promoted, from one country to the other, which tended to correct that variation. The shipping of copper, or wheat, or corn, or coal, or any other common commodity would have corrected this balance, but the freight would be greater, and to this extent only is gold preferable to other commodities for the purpose of adjusting foreign exchanges, and not because it has anything to do with monetary standards.

Promissory Paper for Gold. During the War the gold reserves of the Allies were much reduced and at the same time the pound sterling fell somewhat in value, as measured in dollars; not because there was any fear of currency not being redeemable in gold, but because there was no further supply of commodities, including gold, to adjust the adverse trade-balance with Great Britain. This balance had to be taken care of in other ways; one way was a sale in America of securities that had been held in Britain, and another way was the placing of loans in the United States. The latter is a promise to return American money at a future time, but that payment when it becomes due may almost as well be made in other commodities as in gold. The fact remains that at the present time the commodity exchange of gold has almost disappeared and there is left simply a promise to pay, based on American currency (paper money), but actually payable in any commodity that can be sent to the American markets in exchange for such currency. The ratio of money-standards might be retained indefinitely, and even bettered or perfected by a continual adjustment of credits between the two countries, without any use of gold whatever. A government whose honor, solvency, and future were absolutely beyond question would hardly need any reserve of gold at all to guarantee its currency, as long as it bought and sold its own securities freely at prices that would just prevent any appreciable demand on it for gold. In this way trade-balances would be adjusted directly or indirectly with securities instead of with gold. If governments had been competing financial corporations, like banks, they would undoubtedly have done more than they have in providing for such trade adjustments; the miner has benefited by the liberality of the politicians. There is now over three billion dollars worth of gold in the United States, about half of which has entered during the War, and, this half may certainly be called an excess over the most urgent needs of the country. By holding this extra gold, the people pay interest to the extent of over sixty million dollars per annum, which is probably as much as the whole expense of straight gold mining in the United States at the moment; in other words, if the Government put this excess gold out at interest, it could keep all the gold miners without their having to work at all, or if it required them to work, it could put sixty million dollars worth of new gold into the Treasury without drawing anything on the world's present supply.

Substitution of Confidence for Gold. The internal economic system of the United States has not been without parallels to the foreign exchange conditions just mentioned; gold payments have in the past been entirely suspended and only resumed when economic freedom was entirely restored. In the interval there was nothing to sustain the value of the dollar but confidence in the future of the Government. Similarly, in trade and industry use is made of the deposit currency system where confidence is placed in a bank having reserves of, say, only 15% of its deposits. Little money is used, business being done by means of checks, which is a

method the banks have invented to save them carrying a larger percentage of currency in proportion to deposits, which extra currency would be so much wealth, bearing no interest, and therefore a virtual loss.

Under the old system, the National banks bought from, and deposited with, the Government, the interest bearing bonds that served as security for the currency they issued. This remunerative system allowed for little flexibility of currency and was replaced just before the War by the Federal Reserve banking system, whereby currency is issued against commercial paper (promissory notes, etc.), and secured by a gold reserve of 40%. Although this is sufficiently remunerative to the Federal Reserve banks, it is seen by the light of war experience that there is locked up in the vaults a very large sum in gold that, if it were owned by the Government, could be mostly put out at interest without causing any want of confidence on the part of the public, which in the end necessarily pays the bill.

Necessity of Staple Exchange. The extent to which all the above mentioned ways of dispensing with gold are carried is for the most part a matter of convenience and there are in general two opposite conditions fixing the amount of precious metal it is most convenient to carry. If we wish to measure off a mile, we may have a tape a mile long or one only a foot long. The most convenient way, however, would be to have a tape about a hundred feet long. Too much gold is an inconvenience to a government because it does not bear interest; it is obvious that there is also a lower limit.

When the European countries that have been at war go back to international trading they will have too little gold to be convenient. Confidence is well enough so far as it goes, but there is no exact measure of it and large foreign business has to be done on narrow margins of exchange. If the American merchant buys goods in Europe on three or six months credit, he will want to know precisely how much they are going to cost him when the payments become due. When the ratio of standards was preserved altogether by a free exchange of gold he knew precisely, and under present conditions, involving so many unknown factors, gold exchange will still be necessary. Lloyds might guarantee against losses from instability of exchange, but the charge for such insurance would be equivalent to an adverse difference in price and would act against the country where that charge was greatest. Other things being equal, therefore, the country with the most stable exchange will be the most profitable to deal with, and consequently there will be great competitive efforts made by European countries to protect their exchanges, both with commodity gold and by every other device we have mentioned.

Stabilization of Exchange. Most of the European countries that before the War were financially strong and could to a large extent have substituted confidence for reserves, are now weak, and, in fact, not far from bankrupt. When a business concern is known to be financially weak it is necessary for it to do business in cash, instead of in credit as a financially strong concern can do. There is no lack of experience with such countries. They have for a long time been rather the rule in the Americas than the exception. We may not expect that specie will be used exclusively as in India, but we may take the following two phases from Mexican experience as being illustrative of the extreme conditions to be anticipated in Europe.

In the times of the Diaz and Madero administrations, the Government itself did not form so much a basis of confidence, but what it lacked was supplied by banks having foreign backing and ostensibly independent of the possible want of permanence or responsibility of the Government or of its acts. Although such banks were much more than solvent it was necessary, in order to sustain a fixed foreign exchange, for them to keep a metallic reserve of 50% of the face-value of currency issued and to exchange freely for specie upon demand. If the Government could have sustained the currency with less reserve, it would certainly have done so.

The second illustration may be taken from the happenings of the year 1916, when after some years of continuous revolution the Government's own paper was the only currency, and there was no confidence whatever. A certain amount of currency was required for internal business, but some internal and all external transactions were done in foreign bank-drafts, mainly on New York. In the absence of a fixed foreign exchange, however, business was extremely difficult to transact as the burdens of foreign exchange variations was thrown on the retail merchant. All business was therefore much restricted, being only promoted by the chance of making exorbitant profits at the expense of the consumer. Finally it was recognized that the Government would continue indefinitely to increase the total face-value of the currency by issuing more and more of it; consequently foreign exchange had a continual downward trend. It was not a gamble to retain currency even for a few days but a sure loss, and no more of it was held than could be helped, arrangements being made when possible to buy one thing before another was sold to get the necessary money. From this cause the total intrinsic value of the currency in commodities and wages was much restricted. As, however, no one wanted a bank account, and no bank would keep one, Government currency was needed for all transactions.

In the last mentioned case it is seen that the value in some staple standard of the total amount of currency is equal to the total amount in business transactions taking place in a day multiplied by the average number of days the currency is held between being received and being paid out again. This principle applies universally to currency, because when some of it is hoarded the time the total currency is held is increased in exact proportion to the relative amount hoarded. When business is done by check the total value of paper so passing through the banks is the amount of business in 'deposit currency' and must be added to the business done in legal currency. Also, before the principle is applied the total amount of currency must be understood to include the bank de-

posits. In New York city the rapidity of business transactions is such that the whole volume of deposit currency, amounting to four billion dollars, may be said to be drawn from and refunded to the banks once a week. Bills of exchange and other forms of 'credit currency' may also be understood as currency at their face-value and each endorsement represents an extra business transaction of the same face-value. Promissory notes may also be included, these being considered as separate loan transactions and entailing an extra item of business, even when they are paid for goods, because this amount of extra currency is presumed to exist during the life of the note. Commercial paper, rendered convenient by mutual confidence and stable standards of exchange, is so flexible that the total volume of currency substitutes adjusts itself to the standard exchange instead of the exchange having to adjust itself to the volume of currency. In countries where such a system is not well developed the foreign exchange cannot be stabilized even when it is entirely metallic. Such, for example, is the condition in Mexico at the present time, its gold currency being at a premium because it is short of the present demands, and other or foreign speecie is not legal tender even if obtainable. If, on the other hand, the Mexican government had forced the hoarding of it within the country, the exchange would have gone in the opposite direction, as people do not usually want wealth that produces no interest.

It is entirely probable that in the various European countries that have been at war conditions of foreign exchange will be in vogue, varying all the way between the extremes of Mexican economics.

GRESHAM'S LAW throws an instructive side-light on the function of money. It states that when there are two or more kinds of money in a country, that one tends to become current which has the least stability and the other more staple money is held by individuals to be used only on emergency. This is precisely what has been happening in European countries that have introduced paper currency where previously there was a metallic one. There is thus stored away out of sight a considerable volume of gold and silver. Gresham's law arises from the well-known fact that a holder of the commodity in least general demand has to exert himself most to sell it. The general commodity needs little advertising, the special one a great deal. If a manufacturer of copper ingots can put his product on the market at a tenth of a cent per pound cheaper than his competitors he can sell all his output without any advertising at all; but the manufacturer of sewing-machines has to spend about 100% on the manufactured value in order to sell his product in the face of competition; merely cutting the price a small percentage does not suffice. Now, currency is the most general commodity there is and when the owner of it offers it in exchange for a less general commodity he has the option of choosing the least staple form of it and making the owner of the less general commodity take the risk; in fact, the latter can well afford to do so, as an immediate acceptance of exchange for currency rids him of further selling expense to that degree. There is a limit to the extent this law applies, however, because when currency becomes too unstable the owners of commodities prefer to hold them to selling them in the unstable form of money. The consumer is then forced to draw from his stock of more stable currency in order to live. This is what happened in Mexico in the latter part of 1916 when, almost over-night, Government paper was thrown into disuse and gold and silver specie, which had been hoarded, came into general use.

ESTIMATE OF CURRENCY. In countries such as India, where the use of banks is not universal and coin is apt to disappear from one cause or another, the following method can be employed advantageously: A large number of coins are marked or a peculiar issue is made and on a fixed date these coins are fairly distributed by the banks of the country. Each day, week, month, or year thereafter the banks count the amount in marked pieces returned and compare this with the whole turnover for the same time. The currency in circulation then holds to the turnover of the banks the same proportion as the total number of marked coins distributed does to the number of those returned in the particular period during which the turnover was taken. During the first days, weeks, or months the marked coins are being distributed among the outlying population and the estimate of total currency obtained is therefore too small. Later on the process of hoarding becomes evident, so that after a number of years the figures obtained can hardly be called currency in circulation, but are more nearly the combined amount used up in the arts, hoarded, and in circulation, to which combined amount the figures approach asymptotically. Corrections have, of course, to be made for additions to circulation, the relative effect of these additions at any given time being proportional to that found for the marked coins. Variations of the method explained may be used to advantage and they gradually merge into that of replacing new kinds of currency in known amounts for old, which are withdrawn from circulation by the Government.

THE WORLD'S AVAILABLE GOLD is a large static quantity; there being about nine billion dollars worth visible and no one knows how much more is kept out of sight. It is not like most other commodities, which are mainly consumed as they are produced. A year's supply of gold is less than half a billion dollars worth and only alters the total amount in use or reserve by a small percentage. Consequently, no one but the miner worries much about the amount being mined. What they do worry about is how to get some of the big pile that has already been mined. At the present moment a large part of that pile is in this country, and not the least problem of the European nations will be how to get enough of it over to their own countries so as to stabilize their monetary exchanges and give other nations assurance as to the precise exchange-value of the commodities they buy or sell in the money of those countries. The loaning of gold to the European countries would not only

be good business on the part of the United States, because of the revenue the investment would bring, but it must be obvious that it serves this country no purpose to stabilize its currency to any greater extent than that of the country having the next most perfect stability of currency. It is abundantly clear that internal prices of wages and commodities have in these days nothing to do with the standardizing of money; what counts is the stabilization of foreign exchange, and that is a relative quantity in which two or more countries must necessarily take part.

Oriental Demand. It will be seen, therefore, that so far as the above causes go, the gold to be mined in the near future is an uncertain residual quantity, a difference between a large supply and a large demand, the latter of which cannot be exactly estimated. With the decreasing production of silver and the increasing trade of India, China, and their neighbors, there is a large yearly demand for gold, which is practically consumed. How much is hoarded as coin and how much goes into jewelry is hardly known. In the last ten years India has consumed in coined gold almost half a billion dollars, or more than 10% of the world's production. Normally the rest of the world consumes about 13% of the production in the arts and some further quantity of coined gold disappears so that probably about one-third may be considered to be consumed and this quantity must necessarily be supplied by the mining of new supplies.

Probably about 20% of the world's gold is produced as a by-product in the mining of silver, copper, lead, and zinc, and about 30% is mined in countries of low wage-scale that are not affected much by outside economic conditions. It is quite possible therefore that the effective pinch inducing suitable economic conditions for the mining of gold in countries of high wage-standards might be a long time in coming if there were no other forces at work toward that end than the mere scarcity of the precious metal.

Artificial Economic Conditions. From the economic point of view, war is an artificial condition. The ordinary forms of competition between individuals and groups of a few individuals is dispensed with or becomes subsidiary to the larger grouping along lines of nationality. The making of great loans by the United States to the Allies has not been prompted by business judgment but by the necessities of war. Internally the free exchange of gold for currency has been curtailed. Wheat is no longer handled competitively; not a grain is bought or sold on the floors of the produce exchanges of the country. Most other basic industries are largely under Government control and internal competitive conditions have in general been destroyed. Europe has not been manufacturing commodities for foreign markets and free international trade conditions have been, for a time, eliminated. In fact, the whole economic structure is artificially propped up on every side so that natural adjustments do not any longer take place. The question now comes as to how the props are going to be removed without knocking them out and thus cause a catastrophe.

Natural Economic Equilibrium. No one believes more strongly than I do in the desirability of allowing natural functions to adjust themselves. But when artificial conditions already exist they must be removed by artificial means, little by little. One keeps health best by obeying nature, but having substituted artificial conditions of living one must generally resort to artifice to reduce the shock of a too sudden return to nature, which might prove fatal. It is not to be expected therefore that unconstrained economic conditions can be resumed without the aid of some artificially created spring or buffer interposed for the purpose of preventing the injurious economic impact that would otherwise result. Before we can say what is the best artifice to be employed we must know precisely what are the evils to be met; what kind of an impact has to be avoided.

The Evils to be Faced. A large part of Europe has been used to subsisting on foreign trade. In this country that kind of trade has heretofore been only incidental. The European countries will try to come back to the economic standards and conditions that make foreign trade most profitable, and then, as the more pressing needs of the market are satisfied, to those refinements which are necessary in keen competition for foreign trade, one of them being gold reserves. A concern under heavy financial strain will sell almost anything it has in order to pay its pressing debts. Besides the principal of the debts that Europe owes and is still accumulating, there is the interest to be taken care of, all of which, as far as the United States is the creditor, has to flow into this country in the shape of commodities, over and above the pre-War amounts, which were limited by the volume of exports, mainly of food and raw material.

In the absence of any artifice to prevent it, the American market will be over-run with European goods. Thousands of people in the East are trying to figure out how they can profit from this condition. If no means is taken to prevent it, the working-man, not realizing what is going on, will persist in retaining his high wages; factories will knock off hands or proclaim lock-outs. Great numbers of men will be thrown out of employment; bread-lines will form, and finally, after no one knows what ignorant strife, a lowering of wages toward the European level will result inevitably.

The Cure Suggested. The evil to be avoided therefore is in the lowering of wages and the question is as to whether to have an artifice to prevent this lowering of wages or to have one to accomplish it in a proper and orderly manner. The only practical artifice to prevent it would be a high tariff-wall to keep foreign goods from being sold on the American market. It may be seen, however, that this would be only a temporizing measure, for the country can never enter beneficially into foreign trade in manufactured goods unless it opens its doors. The natural resources of the country are such that little raw material is needed from the outside, and if manufactured goods cannot enter, no immedate benefit will be

received from excess of exports. The first problem is to get immediate material benefit of commodities from anywhere and not to accumulate more credits. The great consuming fire over in Europe has had to be fed for years and the country is in need of everything it can obtain from the outside so long as it can absorb it and at the same time keep its own industries producing to their full capacity. The great problem of which we are speaking comes after this absorption period. The undertaking of extensive constructive work by the State might temporarily relieve the distress from over importation, but such a measure would not be final.

This country, in the course of its development, has reached the stage where it can support itself independently of outside aid. It can manufacture everything necessary for the consumption of its own inhabitants, and its own resources and basic industries can supply everything necessary in the way of raw material. This stage of development is a very desirable one, from the point of view of war possibilities, because no blockade can have any effect. This end has been reached by a minor blockade, called the tariff, which has in this sense been a sort of mild preparation. The dog learns to fight when playing as a pup, or the cat to support itself by playing with a ball of wool when a kitten.

This condition of independent self-support is, however, not the condition of maximum continued prosperity for the people; it is not the condition where the laborer can in the future obtain most commodities for his daily wages or where the continued expansion of industries in proportion to increase of population and increase of efficiency of labor can take place to the best advantage. Already before the War, in 1914, there was a sort of tightness to be felt in the condition of expansion and the pendulum had swung in favor of lower tariffs. It was beginning to be seen that some things could be manufactured to better advantage in other countries and that home industries could be concentrated to better advantage on the manufacture of the things it paid to export. Naturally there was always the opposition of the unsuitable industries, both of the capital so employed and of the labor. There was also the delusion of the average workman regarding the reason for the standard of American wages being higher than that of Europe. Except in so far as superior natural resources may be of advantage, the relative wage conditions in one country can be of no advantage to it, if in any case the wage-earners consume the full value of all the commodities produced. The higher wage may simply mean that the price of commodities is raised in the same proportion as the scale of wages. On the contrary, the condition of greatest prosperity for all the people of the country will now only be reached when the trade-doors are opened wide and there is a free interchange of commodities. Natural resources are not in any case restrained from flowing out of the United States and other commodities have to be returned for them—unless foreign investments are made. Consequently, it pays best to have returned those articles which can be produced to the best advantage in other countries. Money does not come into the question at all. It simply cancels itself out in the two operations of selling one thing and buying another. What we must consider is the resultant exchange of commodities, and in the end the people can get out of the country just exactly what it produces in raw material plus their own efficiency in doing the work which gives them the best living, not in money, but in everything they need to live with.

Certainly the country has benefited in the past by there being fewer people to take advantage of its natural resources, and in the scarcity of labor it has benefited by the incentive to greater efficiency. As more people came it continued to benefit by finding employment in artificially protected industries for what otherwise would have been an excess of population. But a time has come when the measure is full and ready to overflow. There is still the advantage of raw materials conveniently situated, but the manufactured goods produced are sufficient for all the people, and except for the country's advantage in natural resources and greater labor efficiency, which it will retain in any case, it is virtually on a par with Europe, and the consideration of relative monetary values simply confuse the issue.

In order to deal with the problem definitely it is obvious therefore that commodities produced must be reduced in price, so as to partly meet foreign competition, and to obtain this end wages must also be reduced. As an artifice is required, why not make it as clear and open as possible so that neither the workman nor the manufacturer may be suspicious? In other words, why not gradually reduce the average price of commodities, and as the reduction is officially reported, reduce wages by similar percentages all around?

Objections Answered. It may be answered that the workman would not understand. The reply to this is that a considerable part of the workmen do already understand. About thirty years ago sliding-scales of wages were established in the coal mines of England. Wages were made to vary with the price of coal. Since then the idea has been gradually cultivated and of late similar sliding-scales have been regulating the wages of a large part of the copper-mining industry in the West.

In purely manufacturing industry where there are also raw materials to be bought at varying prices and there is no regular product, such as ingots of copper, it is not possible to arrange sliding-scales on the basis of any particular commodity. Normally it is not as necessary to do so, because most prices do not vary like those of copper. There is, however, something that affects the workman much more intimately than the price of copper affects the copper miner, namely, the price of the average commodity he has to buy with his wages. If the artifice is arranged so that he will be able to get just the same commodities with his wages as he does now, until normal conditions are resumed, he can be satisfied; that is to say, if his desire and that of his leaders is to prevent trouble.

There is no necessary limitation to the activity of the

trade-unions involved in the above plan. If in a certain section of the country and during a certain period, a 5% reduction in commodities had been effected, then an order would be issued by the central authorities for a reduction during the next period of 5% in all wages. This would in no way be interpreted to prevent a strike in any certain factory for a raise of, say, 10%, and such strike would adjust itself along ordinary lines.

If the manufacturer objects because he considers his prices would be artificially cut, it might be replied that no cutting would be necessary in most branches of industry. This will occur by anticipation of foreign competition and by anticipation of the lowering of wages. Naturally, though, during the process of reduction there will be hand to mouth trading. No one will want to carry any more stock than is absolutely necessary, either of raw material or of manufactured articles. This, however, will be no innovation but simply a continuation of the conditions created by the War.

If the manufacturer considers that factories would close down during the reduction process, the reply is that this will only happen if the initiation of the reduction process is delayed. It is simply a race between European and American factories, and if the latter cannot compete for the home consumption while Europe is supplying the crying demands of the rest of the world, they had better give up all idea of competing for foreign trade later on. No one can deny that to begin with, European prices will be high, but it will be a grave fallacy to presume that they will remain so. The world has to a considerable extent learned to do without many things which were previously supplied from Europe. European capital for foreign construction work will be largely wanting, thus further decreasing the demands for equipment manufactured in Europe.

When to Discontinue Artifice. As determining when this process should be discontinued, the normal conditions above-mentioned should however be in no way based upon the cost of production of gold but upon the disappearance of any abnormal tendency for the movement of gold after all countries have a proper share of that metal.

In the manner above described the flooding of this country with cheap European goods would be avoided. Simultaneously attempts to sustain wages, resulting in the closing of factories and the formation of bread-lines, would be corrected by mutual consent in such a manner as not to affect the workman either in the purchasing power of his wages or in his right to strike for an increased purchasing power. It should not affect the American employer because it would only be carried at each stage to the extent necessary to prevent adverse trade-balances with foreign countries and internally all would be in the same boat, though the basic industries would doubtless enjoy most prosperity. The present precarious conditions would then be gently relieved of the artificial props and finally the sun might shine on the little branch of the industrial tree on which sits the gold miner.

Milling the Bawdwin Mines Ore

The mines of the Burma Corporation in upper Burma, India, are estimated to contain 4,033,000 tons of ore assaying 24.7 oz. of silver, 27.4% of lead, 19.1% of zinc, and 0.4% of copper; also 105,000 tons averaging 21.0 oz. of silver, 19.9% of lead, 8.8% of zinc, and 8.9% of copper. During 1917, according to the report just to hand, only high-grade lead ore for the smelter was extracted, also some zinc ore for export. Construction of the new 1000-ton mill was commenced near Namtu late in August of last year.

After discussion with the staff at Namtu, it was decided to divide the program into two stages; a preliminary system that would convert a maximum proportion of the lead, zinc, and silver into standard metallurgical products, with only secondary attention to total extraction; and a final system that would give maximum recoveries with less rigid requirements as to classes of products, according to the report of Lawrence Addicks.

The preliminary flow-sheet included crushing the ore to ½-in. size. Jigs would yield a lead concentrate and tables a zinc concentrate and gangue, the latter to be stored. From the middling would be a slime product, while the coarse material is ground to 200-mesh. This product would have a soda flotation, producing both zinc and lead concentrates.

The final flow-sheet included crushing the ore to ⅛-in. size. Jigs and tables would give similar concentrates as in the preliminary method. The gangue from the tables would be ground to 80-mesh, given an acid flotation, yielding gangue and middling. The table middling gives slime as before, this to be given acid flotation, from which would be produced gangue and middling. All of the middlings, constituting 51% of the weight of original ore, and assaying 27.3% of lead, 29.9 oz. of silver, and 29.0% of zinc, might then be treated by some chemical process. The gangue would be 19% of the weight of the ore, carrying only 2.5% of lead, 4.0 oz. of silver, and 2.0% of zinc.

The general program recommended is: (1) That average ore be sent to the mill operating on the preliminary flow-sheet previously described. (2) That the lead concentrate produced be treated for the time being at the present Namtu smelter, with such temporary capacity additions as may be required, any excess base bullion over refining capacity being exported to England. (3) That a zinc-retort smelter and acid plant to treat 25,000 tons of zinc concentrate per year be erected at once at Sakchi, India; any excess concentrate produced being sent to England when shipping conditions permit. (4) That the experiments already under way for the choice of a suitable process for the treatment of middling be prosecuted vigorously, and that upon satisfactory results a commercial plant be erected in England. And (5) that final decision as to the ultimate mill flow-sheet, modern lead smelter, etc., be deferred until both the post-war probabilities and the results of the metallurgical experiments are reasonably certain.

EUREKA, CALIFORNIA

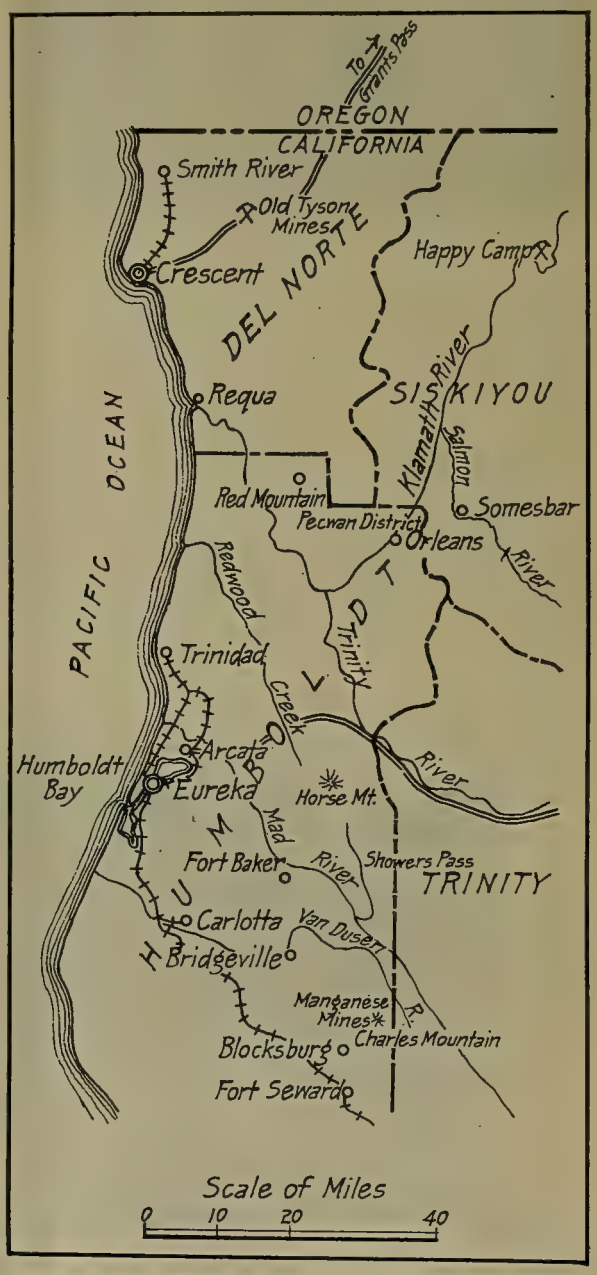
Chrome and Manganese Mining in North-Western California.

Mining operations throughout north-western California have ceased for the winter, recent rains having made the roads impassable. This applies to chrome and manganese mining in Del Norte and Humboldt counties, in both of which there has been unprecedented activity during the past season. The future of these war minerals, especially chrome, is a subject of much discussion among local mining men, and one on which there is a wide divergence of opinion. Many new deposits in Humboldt have been opened through the expenditure of large sums of private capital in order to meet the Government's urgent demand for chrome, and these men may lose heavily unless immediate steps are taken to steady the market by the time weather conditions permit resumption of mining in the spring.

The chrome belt in north-western California extends from Del Norte and Siskiyou on the north, in a southerly direction along the border between Humboldt and Trinity counties, in the form of a triangle with the base resting on the Oregon boundary line. This is known as the serpentine belt. Taking in the greater part of Del Norte and western Siskiyou, the region comprises the Orleans district, and includes the Red Cap mountain on the Klamath river on the one side and the Slate and Bluff Creek regions on the other side of the stream, thence down Trinity river following the range of which Horse mountain is part. The manganese belt extends through the southern part of Humboldt county. The largest occurrence of this ore in the State is said to have been located in the Fort Baker range lying between the Mad and Van Duzen rivers. The richest ore is in the Charles Mountain district near Fort Seward. Manganese was also mined in considerable quantities in the Alderpoint district during the past summer.

Roughly estimated, the total quantity of chromite passing through Eureka during the past season was upward of 125 carloads, approximating 6250 tons, By far the greater part of this came by schooners from Crescent, which is the natural outlet for the rich chrome mines of Del Norte. The groups of properties, including French Hill and the old Tyson mines, the Rattle Snake, the High Plateau, and the Preston Peak districts, operated by R. D. Adams of San Francisco, have shipped about 3500 tons by way of Eureka; while the California Chrome Co. sent out upward of 1000 tons. An estimate made in August last showed that the Del Norte output consigned to Eureka for transfer and shipment by rail was about 4000 tons. A large quantity was also sent from that section by the Hobbs, Wall & Co.'s lumber steamers plying direct between Crescent and San Francisco. The Red Mountain mines on the Klamath, and those in the Pecwan district in lower Del Norte, also mined several hundred tons, sending it down the Klamath, where it was transferred from truck at the Requa docks thence by schooner to Eureka to be shipped by rail to San Francisco. In Humboldt county, the principal chrome producers have been the Horse Mountain Copper Co.'s mine and the adjoining property of the Humboldt Copper Co., situated in the serpentine belt that extends along the eastern border of the county. The Horse Mountain mine supplied 350 tons during the past summer.

The difficulties under which all these ore deposits were opened and sent to distributing points from which they



MAP OF NORTH-WESTERN CALIFORNIA, SHOWING CHROMITE DEPOSITS

could be shipped can only be thoroughly understood by a study of the topography of the country in which they occur. In the early 'fifties, the chrome occurrences in Del Norte were practically the only known deposits in America, and those accessible from Crescent were mined extensively to supply the domestic demand. The entire section is a rough, heavily-timbered, mountainous region, making construction of roads to the properties a difficult, and in some instances, impossible task. Accordingly, when the mines farther east found an outlet through Red Bluff and other valley ship-

LOADING BURROS WITH CHROMITE AT THE TOP OF RED MOUNTAIN, HUMBOLDT COUNTY, CALIFORNIA

ping-points, the coast mines closed down or ceased to operate except on a moderate scale.

The difficulties of road-building that presented such obstacles in the early days have been again encountered by the chrome miners operating in Del Norte and Humboldt counties during the past summer. However, the high price of ore, and the tacit understanding that the Government would ensure a market for the product during a period of one year following the signing of the peace treaty, led to the expenditure of large sums in road construction, also in building ore-bunkers and accommodation for employees, etc. The road leading into the High Plateau district is estimated to have cost the Adams people about $24,000. Plans were outlined for the construction of another road to cost twice this sum to serve another of this group of mines, but work has been delayed or indefinitely postponed by winter. The Board of Supervisors of Del Norte used the entire amount ($12,000) of the county budget set aside for road-building for the improvement of the main 'artery' that served as an outlet for the mining districts. This is the Grants Pass road and will later become a part of the State highway.

The difficulties that have overtaken Mesler and Mitchell of Eureka, operating the Red Mountain mines on the Klamath river, 14 miles from Requa, is an instance of circumstances that operate against Californian chrome men. These properties contain large chrome deposits lying near the top of a 4000-ft. ridge. To get the ore down to the river level, it was necessary to cut a precipitous trail seven miles long for a pack-train. Several States were visited in an effort to get a sufficient number of pack animals, and a train comprising 34 mules and 55 burros was finally assembled. The ore was transported by these from the mines to the river, thence down the Klamath to Requa, where it was sent to Eureka. Notwithstanding these difficulties, quantities of excellent ore were extracted. The company had planned the construction of an aerial tram, which, with the widening of the 4-ft. Federal trail following the river, would have greatly expedited transportation of the ore. Then came the unexpected slump in the chrome market, with the result that the holdings of the company, including 150 tons of ore lying on docks at Eureka, Requa, and the mine, are held under attachment by creditors, and the company faces a loss of $25,000.

The old Tyson mines, in the Smith River section, that were closed when chrome was selling at $8 per ton, and have lain idle for the past 38 years, were unwatered and cleaned out at great expense to the R. D. Adams company. The difficulty of obtaining machinery and the scarcity of labor were other things that delayed work until late summer, so that the first carload of ore from these holdings did not start to market until September. The Adams people are still shipping some ore from Crescent as weather conditions will permit, a contract protecting them in a measure from the sudden slump. It is estimated that this company has now approximately 1000 tons available at Crescent and the mines operated by them nearby. This will be shipped as rapidly as possible.

Recent news from Crescent indicates that the 'fleets' of

VIEW SHOWING THE KLAMATH RIVER AND CHARACTER OF COUNTRY IN THE RED MOUNTAIN CHROME REGION, HUMBOLDT COUNTY, CALIFORNIA

trucks engaged hauling ore in that part have all been called in, and that shipments of ore from there will consist henceforth of that lying on the wharves.

The outlook for manganese miners in southern Humboldt county is much brighter than in the chrome field, as there continues to be a good market and the companies are largely protected by contracts. This group of mines, including the Fort Baker, Charles Mountain, and Fort Seward deposits, are operated by Irving and Doak of San Francisco. Work is now at a standstill on account of rain which has put the roads out of commission. However, it is expected that work will be resumed in the spring on as large a scale as that of the past summer. Similar transportation difficulties were encountered in getting manganese as in chrome mining. Seven trucks were employed to get the ore out to the shipping points on the Northwestern Pacific railway, and it was necessary for the company to construct many miles of new road-bed for this purpose. The Fort Baker ore was trucked 29 miles to Carlotta, five miles of which was constructed by the company at a cost of $5000. The output from Charles Mountain and Fort Seward was trucked to Point Seward, construction of four or five miles of new road being necessary in this instance also.

The total output marketed from the three mines during the past season was 1300 tons. There are 3600 tons blocked out at the mines, to be moved in the spring. About 11 carloads of ore were taken from the Fort Baker mine, and a similar amount from Charles Mountain, the latter having some of the richest found anywhere in the country. The mines above Fort Seward yielded seven carloads, averaging 45 tons per load.

CRIPPLE CREEK, COLORADO

Gold Output and Dividends.—New Orebodies in Small Mines.

The November gold output, the lowest for the year, due to the epidemic of influenza, causing mines and mills to work short-handed, in some instances to suspend operations, totaled 68,476 tons averaging $10.14 per ton, making a gross value of $694,963. Compared with the preceding month there is a decrease of 20,476 tons and $160,310.

Some individual returns were:

Mine or works	Tons	Average per ton
Golden Cycle	25,000	$20.00
Portland	29,426	2.13
Vindicator	1,500	1.75
Big Toad	800	4.20
Smelters	1,750	60.00

November dividends were limited to the monthly distributions of the Cresson of 10c., or $122,000, and Golden Cycle 3c., or $45,000.

The Acacia Gold company has closed its South Burns mine on Bull hill for the winter. The W. P. H. Leasing Co. also closed the W. P. H. mine of the United Gold Mines Co. on the same day, for the winter.

A new surface orebody has been opened on the Ella W. on Tenderfoot hill, not far beyond the corporate limits of Cripple Creek, by M. Johnson, lessee. The ore is worth $10 per ton.

The shoot on the 950-ft. level of the Jerry Johnson is persisting. It is now nearly 50 ft. long, and the ore shipped carries close to 2 oz. per ton.

A new vein at the Longfellow on Bull hill has been opened by the Excelsior M. L. & E. Co., lessee from the Stratton estate. The orebody is 14 ft. wide. The screenings will carry 5 oz. per ton.

The Modoc company sent three cars of 5-oz. ore to the Golden Cycle mill during November. Seven machine-drills are working, two on ore at 1200 ft. and five on development. A. H. Frankenberg is manager.

BUTTE, MONTANA

The Manganese Situation Here and at Phillipsburg.

The armistice had the immediate effect of curtailing manganese mining in Montana. The reason for this is the ability of Eastern steel interests to secure transportation of manganese ore from Brazil and Cuba, thus reducing shipments from the West to quantities specified in contracts. The effect of the decreased output will scarcely be noticed at Butte, because of the relatively small number of men engaged exclusively in mining manganese. In the Phillipsburg district, however, the situation is much different.

The Emma mine is the largest producer of manganese ore in the Butte district. It is operated by the Anaconda under a long-time profit-sharing agreement with the owners, the Butte Copper & Zinc Co. The output of this mine during the War was said to be approximately 10,000 tons per month of rhodocrosite, 8000 tons of which was shipped to Eastern consumers, and 2000 to the ferro-manganese plant at Great Falls. The yield at present is 2500 tons monthly. It is thought that the ferro plant at Great Falls can be kept operating at its present capacity and compete successfully with foreign ores as far east as Chicago.

The Phillipsburg district will probably return to its prewar basis, because of the lessening demand for Western manganese ore in the East. The Phillipsburg Mining Co. has contracts for delivery of manganese that will keep it busy until spring. But several other companies are not so well situated, as they have spent large sums on development and new equipment, expecting a continued demand at the Government price, and are now in a fair way to lose on their investment, as they had just reached a profitable basis when the slump came.

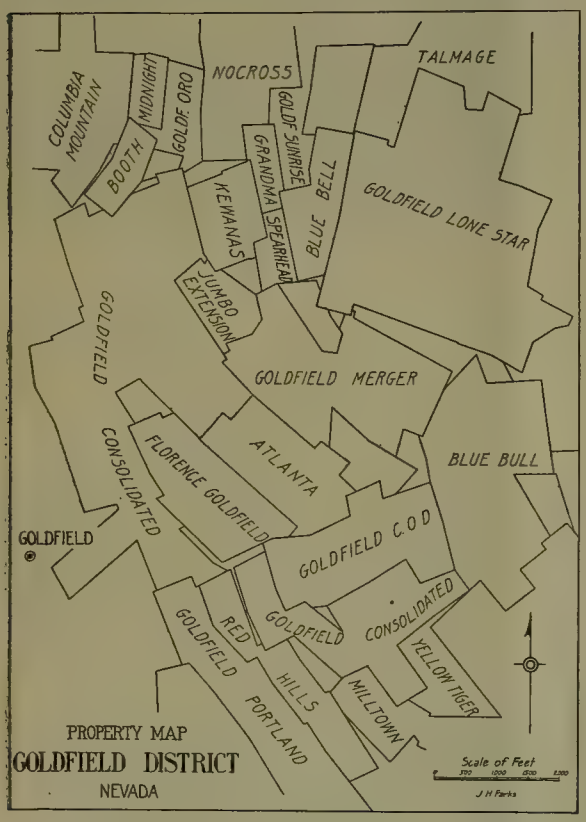
GOLDFIELD, NEVADA

Current Development Work in the District Detailed.

Discoveries of pay-ore on three deep levels in the Goldfield district, together with plans for expanding work on other properties, have caused a revival here. About mid-November, seams of good ore were cut in the Spearhead, in extending a south drift on the 910-ft. level. The drift has progressed farther to the south-west, in the contact zone between the latite and shale, exposing other and wider veins of good ore; while a cross-cut to the south-east has shown ore of similar grade in passing through 30 ft. of quartz lying immediately upon the shale. This ore-channel lies in direct line on the easterly dip of the shale with the contact orebody opened four years ago in the Jumbo Extension mine, a short distance to the west; and the Spearhead workings are said to be within less than 100 ft. of the east side-line of the Sunflower claim of the Merger Mines Co. The samples obtained by the superintendent, H. F. Bruce, over widths varying from 18 to 36 in., assayed from $42 to $200 per ton in gold, silver, and copper. The ore is the typical deep-level ore of the district, treated by smelting. The discovery was made in virgin ground, nearly a claim's width from the nearest point where the contact zone has been penetrated. The new ore-shoot appears to bear out somewhat the theory of H. V. Winchell, Jr., W. H. Wiley, and others, who studied ore deposition here in connection with the Booth apex controversy. They considered that enrichment would be found to extend toward the axis of the syncline formed by the shale, rather than along the trend of the ore-channel that parallels the syncline, and that farther west and north is related to the great Columbia Mountain fault. These geologists conceived the presence of barren areas in the zones extending downward along the rather flat incline of the shale, but advised further prospecting of the contact channel in line with the dip of known orebodies. During the period that the rich Jumbo Exten-

sion orebody was being developed, the Merger Mines Co. extended a long cross-cut from its main St. Ives shaft on the 1100-ft. level to the north-east, then north along the west sideline of its Sunflower claim. Difference in shaft elevation brings this cross-cut to less than 100 ft. below the Spearhead 910-ft. level. If the Spearhead orebody extends into Merger ground it can be reached from this Sunflower cross-cut within approximately 500 ft., or from one of a series of incline and vertical raises above this cross-cut.

Deep work in the Atlanta mine, impeded for a time by the shortage of labor, has made satisfactory progress. A raise from the 1850-ft. level, following the incline of the shale foot-wall, lately exposed an ore-shoot that is being developed by drifts, and is showing 6 ft. of shipping-grade ore. Other raises from the 1850 and 1900-ft. levels and cross-cuts from the former level have exposed large bodies of ore that can



be treated profitably by flotation, and a large quantity of good flotation ore has been blocked out between the 1400 and 1750-ft. levels. The flattening of the main vein below the 1750-ft. level entails much more work at deeper levels than was counted upon when the vertical winze was sunk from the 1750 to the 1900-ft. level, a short distance west of the foot-wall. Flotation tests on Atlanta ore, which carries gold, silver, and copper, have given satisfactory results; but the scheme to have this ore treated in the Goldfield Consolidated flotation plant was abandoned because of difference in character of the ore from that of the Consolidated, that would necessitate separate treatment, also owing to the lack of a market for flotation concentrate. The Merger shaft, through which the Atlanta is worked, is less than two miles from the mill, with standard-gauge rail connection.

High-grade ore is being broken in the southern part of the Kewanas property. A winze was started from the 840-ft. level here over a year ago by the Jumbo Junior company, then working this ground under lease, and a carload of $85 ore was extracted and shipped. Subsequently the lease was forfeited when the Jumbo Junior was no longer able to work through the Velvet shaft of the Jumbo Extension. Sinking the winze was resumed lately, and at a depth of 100 ft. a drift is being advanced, showing 3 ft. of $100 ore. Development work in the northern part of the property on the 840-ft. level exposed pay-ore at a number of points, one 5-ft. face sampling $65 per ton; and the long north drift, with a number of short cross-cuts, gave promise of a large tonnage of flotation ore. In the northern area the trend of the ore on the dip of the shale is toward the adjoining Grandma Consolidated property, where work has been started in the contact-zone from the new shaft.

The Cracker Jack company has resumed work on the 320-ft. level, at a point where an ore-channel was opened for a length of 150 ft. and some $20 ore found. In addition to this the company has started to develop a 40-acre block covering a part of the Consolidated and Florence ore-channel, where approximately $800,000 worth of high-grade ore was mined below the 450-ft. level. Above this depth the ground has remained untouched owing to the absence of mining facilities; but it is now accessible through one of the best equipped shafts in the district. Good ore is said to have been left in the old stopes, extending to the 450-ft. level, when the leases expired. The Cracker Jack Co. has secured a five-year lease on this ground.

Ore found in the east vein of the Cracker Jack, on the 320-ft. level, contains gold, silver, copper, lead, zinc, and bismuth.

Sinking is in progress on the Silver Pick Consolidated from the 1260-ft. level, and a station will be cut at a depth of about 1320 ft. The shaft penetrated a zone of quartz, containing seams of gold-silver-copper ore and some widely-disseminated molybdenite. Local mining men and engineers regard the prospects in this ground as more favorable than before.

In the Grandma Consolidated drifts are progressing north and south from the shaft on the 815-ft. level, in the shale-contact zone. A cross-cut east from the south drift has reached the shaft foot-wall in quartz that is heavy with iron and contains small quantities of gold, silver, and copper.

The Booth property is not being worked, and the rise in its shares is explained by the fact that it owns 250,000 shares of Kewanas and 750,000 shares of Merger Mines stock, received in settlement of its claim of apex rights.

Ore assaying $20 per ton is coming from stopes in the Great Bend mine, above the 160-ft. level; and raises are being driven from the new 370-ft. level to prospect for the ore-shoots opened on upper levels.

J. B. Kendall, manager of the Red Hill Florence, reports good progress in opening the property on the new 600-ft. level where one vein has been cut, and the east cross-cut is being advanced to reach the Rogers vein, which has yielded high-grade ore on the 500-ft. level. Ore assaying from $15 to $50 per ton is being taken from the 450 and 500-ft. levels and shipped to smelter. The shaft is 800 ft. deep and was re-timbered lately from the 500 to the 600-ft. level.

A narrow vein in the Pig claim of the Blue Bull group, opened by a raise from the 250-ft. level, is producing high-grade gold ore; a shipment from this vein assayed $117 per ton.

Lessees on the C. O. D. Consolidated, working through the Gold Bar shaft, have made several shipments from ore-bodies opened at the 150 and 200-ft. levels. These are distinct orebodies, the first containing only gold, the deeper ore carrying gold, silver, and copper.

Two leases on the Jumbo Extension are producing ore of good grade, but work on company account has been discontinued.

ALASKA

Juneau.—Alaska Gastineau reports as under for the third quarter of 1918, comparison being made with the previous period:

	Third quarter	Second quarter
Ore treated, tons	218,930	309,249
Value per ton	$1.323	$1.164
Tailing value	0.230	0.210
Recovery, per cent	82.39	81.96
Operating cost, per ton	$1.148	$0.998
Loss, per ton	0.055	0.046
Total loss	$11,984	$14,248

Every possible economy is being practised, but the officials are unable to operate profitably; and there seems to be little reason to hope for or expect anything approaching satisfactory results as long as present conditions continue.

In the stopes there is estimated to be 1,832,910 tons of broken ore. A re-survey of the stopes is expected to increase this total considerably. On account of the heavy drawing of ore from the upper levels, a slow crushing movement was taking place, so the upper part of the mine will be abandoned. The remaining ore may be drawn from chutes on No. 9 and 10 levels east. With 150 more men the mine could supply the mill at full capacity. The plant worked only 8 hours daily. There was an average of 359 men employed, a decrease of 65 for the quarter.

ARIZONA

Bisbee.—Copper production of Arizona in 1918, according to J. E. Curry, secretary of the Arizona Chapter of the American Mining Congress, is estimated at 819,000,000 lb., compared with 700,000,000 lb. in 1917.

Jerome.—Connection has been made between the portal end of the United Verde Extension tunnel and the Texas shaft. There still remains 1900 ft. of ground between the west heading from the Texas shaft and the mine heading. Progress is slow on account of heavy ground and water.

Kingman.—It is reported that operations are to be renewed at the Catherine mines at Pyramid. The old mill has been wrecked, but it is proposed to re-build when development warrants it.

Mayer.—The Kay Copper Co. is sinking from 500 to 650 ft. On the 500-ft. level the main south-east cross-cut is in 13% ore, the 53 ft. opened averaging 4%. A north cross-cut is in 6% ore for 46 ft. A new compressor has been erected at the main shaft, while at the Buckeye, 2000 ft. north, a new hoist has been put in, preparatory to extensive development.

The Arizona Binghampton Copper Co. has increased its capital from 340,000 shares, $5 par, to 2,000,000 shares, $1 par. This will give sufficient capital to pay for sinking the new 3-compartment shaft 1200 ft., enlarging the present flotation mill, and perhaps building an aerial tram from the mine to the Humboldt smelter, a distance of a little over 5 miles. The present workings are on 100-ft. levels to a depth of 600 ft. The output of the mine is now 175 tons daily, producing from 25 to 30 tons of concentrate.

Sinking is to be resumed by the Western Copper Co. at a 30-ft. shaft on the Patton ground, south of the Binghampton mine. A strong copper vein is being followed.

The Big Bug Copper Co. has moved a gasoline hoist from one of its properties north of the Blue Bell to a shaft on eight claims at Copper mountain. Sinking is to be resumed next month.

Ore found in a drift in the Little Egypt, half a mile east of Mayer, is widening. A steam hoist has been erected and sinking is to be started at the 100-ft. shaft.

Oatman.—Ore from the Carter mine is being hauled to the United Eastern mill for treatment. The ore is said to assay $27 gold per ton.

It is announced that the Tom Reed Gold Mining Co. has paid a dividend of 2%. This is equal to $18,190 on the 909,555 shares issued.

Tucson.—The Blue Bird Mining Co., which has been operating in the Copper Creek district for the past three months, has ceased operations and is removing the machinery.

James H. Emery has filed suit in the Superior Court to foreclose on a mortgage for $25,000 held on the Emery-Whitcomb Tungsten Co. and the National Tungsten Co. The properties are at Las Guijas.

CALIFORNIA

Coram.—The Balaklala company may extend its aerial tram two miles west from the mine.

Jamestown.—A circular sent out by G. H. Egling at Chinese Camp states that the Calaveras and Tuolumne County Chrome Miners' Association was formed on November 23 by a number of men interested in chrome mining for the purpose of fostering their interests which have

CHROMITE IS MINED NEAR ALL THE PLACES MARKED HEREON, SAVE AT JACKSON.

been seriously threatened by the close of the War and consequent lack of market. A resolution was adopted appointing an executive committee for the purpose of framing and presenting a memorial to local Congressmen and Senators to use their efforts in bringing about relief to this essential industry, and restore the market for chrome and prevent financial loss and ruin to the membership of the Association. B. A. Ogden is chairman, with C. E. Shafer, G. A. Richards, and John Madrid as trustees.

San Francisco.—The California State Mining Bureau has issued Bulletin 83, 'California Mineral Production for 1917', of 179 pages, including county maps. The work was compiled by W. W. Bradley, the Bureau mining statistician. The general make-up of the publication is as heretofore. The various minerals and metals are discussed in 114 pages, while producing counties, with tables, receive 32 pages. The total mineral output in 1917 was valued at $161,202,962, a gain of $33,301,352 over that of 1916. Of this increase, $29,554,875 was due to the enhanced price of oil, which was just under $87,000,000. Copper fell off over 7,000,000 lb., gold $1,323,237, and zinc over 4,000,000 lb. Borax gained 6400 tons, chromite 3400 tons, lead 4600 tons, magnesite 55,000 tons, molybdenite 235 tons, potash 111,000 tons, quicksilver 3000 flasks, and strontium 2793 tons. The general statistics are interesting and cover a number of years. County yields of certain minerals are also tabulated. All Californian miners should secure a copy of this bulletin, as it contains a good deal of useful information.

IDAHO

Kellogg.—The Bunker Hill & Sullivan smelter is being enlarged. The furnace building is being extended 72 ft., to allow erection of two blast-furnaces. Three Dwight-Lloyd sintering-machines have been erected recently, and two more are to be put up, making nine in all. The blower-house has recently been doubled in size, and a Connersville blower of 15,000 cu. ft. capacity installed in the extension. A new compressor-room has been completed and a Sullivan two-stage machine of 1100 cu. ft. capacity erected. In the blower-house a Laidlaw-Dunn-Gordon compressor is being installed, to be used as an auxiliary. According to W. K. Mallette, constructing engineer, the most important construction during the last month is the extension to the lead refinery. This is being enlarged by the addition of 72 ft. on the west side of the original refinery. The retorts were removed from the silver refinery and are temporarily in the lead refinery. A new softening-furnace has been built west of the original No. 2 softener, and two additional desilverizing kettles are to be added. Two new cupelling furnaces have been built in the silver refinery in the space formerly occupied by the retorts. These cupels are much larger than the original double furnace, and have added materially to the capacity of this department. In the furnace building a second traveling crane is to be erected, so that one may be used for the refinery.

Wallace.—Consolidated Interstate-Callahan reports as follows for the third quarter of 1918:

Out of the net value of shipments, $269,858, the profit was $49,128. Costs were high, totaling $8.068 per ton of shipping product at rail, due to $100,309 being spent on development and repairs to the mill; $10,000 per month is also set aside for taxes. These expenditures added 40,000 tons to the mines reserves and increased recovery to 92%. No ore was mined during the period. The mill dressed 42,661 tons of tailing, yielding concentrate carrying 8,117,806 lb. of zinc. Underground work proved very satisfactory. On No. 9 level a continuous ore-shoot of high-grade zinc ore has been opened for 255 ft. On No. 6 level of the Interstate, the cross-cut to open ore in the Nipsic property, cut the vein where it was from 1½ to 3 ft. wide, assaying 25.8% lead and 7.7 oz. of silver, with no zinc. This ore is 1000 ft. below the orebody opened in the upper workings, and a large deposit is expected to be developed.

Control of the Chicago-Boston company has been optioned to J. A. Percival of the Interstate-Callahan. The property has been considered out of the productive belt. Up to 1916 some work was done on a small copper vein. Since then a large lead-silver vein was found, and considerable work done. The Day interests then secured control, and sunk a shaft and opened good ore; but as an extension of the option was not granted they gave it up late in 1917. The new owners will probably deepen the shaft.

MICHIGAN

Houghton.—The Mayflower and Old Colony shaft work continues slowly. There can be no expectation of speed at this property, as the management pays just the regular rate of wages, and it is difficult to obtain labor at an isolated shaft such as is being sunk for exploration of these two properties. It is doubtful whether any exploration shaft put down in this district ever went down at so small an outlay as this one. The underground force sometimes consists of a shift-boss and eight men; sometimes the boss and one man. That depends upon agricultural conditions in the immediate vicinity of the mine. The only course of underground labor is from the farmers who reside on land owned by the mining corporations, and leased by the Finnish farmers from the companies. When these men are not engaged in farming they go underground.

The Seneca shaft is 1600 ft. deep, and going down rapidly. Ten jack-hammers are at work in the bottom. Great interest is being taken in operations for the next few weeks, as the vein ought to be cut by Christmas, if not before. It is calculated that the foot-wall of the Kearsarge lode will be cut at 1730 ft., including the angle.

Winona's new flotation plant will dress 600 tons daily. The machinery is on the way, and the concrete foundations are now in place.

MISSOURI

Joplin.—Production of the Tri-State region last week was as under:

State	Blende tons	Calamine tons	Lead tons	Value
Kansas	394	...	88	$30,160
Missouri	731	253	330	75,451
Oklahoma	2,200	...	575	178,500

Average prices were $52 for blende, $38 for calamine, and $100 for lead.

MONTANA

Anaconda.—The new smoke-stack at the Washoe Reduction Works, 585 ft. high, was completed last week.

Butte.—Davis-Daly's report for the third quarter of the current year shows a profit of $110,466. Receipts were $412,444, and disbursements $301,978. Development covered 2449 ft., costing $87,532. This is an important item, as it is opening new ground, improving ventilation, and proving the apex controversy. The output was 17,697 tons of ore, yielding 2,071,886 lb. of copper and 101,705 oz. of silver.

Twin Bridges.—The Potomac Copper Mining Co. has been organized by N. J. Bielenberg and W. J. Higgins to develop a mine near this place. Among the directors are officials of the Tuolumne Mining Co. of Butte. The capital is $1,500,000.

NEVADA

Goldfield.—Tolicha, near Quartz mountain, 50 miles south of Goldfield, is being revived by E. A. Ludwig and others of this place. Some $30 gold-silver ore is said to be exposed. There was a boom at Tolicha in July of last year.

Pioche.—A considerable amount of surface and underground work has been accomplished during recent months at the Virginia-Louise. A 1000-ft. railroad spur now connects with the Prince Consolidated line, making it possible to ship ore direct at the mine. An inclined ground tramway now connects the receiving-bin at the shaft with the 100-ton bin at the railways. Houses have been erected, also toolshop and sampling-plant. Ore-pockets have been excavated on three levels, and considerable work done underground. So far, 95 cars of ore have been sent to Utah smelters.

Rochester.—The Nevada Packard reports that the contact fault, recently prospected to some extent, is a single orebody which may be mined from the surface for a distance of 1600 ft. It is from 10 to 12 ft. wide, and car-samples for six days averaged $14 per ton. The report for October showed treatment of 2723 tons yielding bullion worth $21,785, with a net profit of $8122, or $2.98 per ton.

NEW MEXICO

Fort Hancock.—At the copper mine of A. Kraft, 12 miles from there and just over the Texas line, a 100-ton gravity concentrating and flotation mill is being built. The ore averages 3%. For two years 5% sulphides and carbonates have been sent to El Paso.

OKLAHOMA

Cardin.—The Oklahoma Ore Storage Association has let a contract for erecting a warehouse of 50,000 tons capacity, similar to that at Douthat.

Douthat.—The Oklahoma Ore Storage Association has started to erect a warehouse here. It will be 400 ft. long and 50 ft. wide, with a capacity of 50,000 tons of concentrate. This is No. 2 of the series to be built in the State.

Picher.—The first of the Oklahoma Ore Storage Association's warehouses is receiving concentrate. Its capacity is 60,000 tons. It is equipped with machinery for handling the product.

Production of the mining districts last week was 2200 tons of blende and 575 tons of lead, valued at $178,500.

OREGON

Gold Hill.—Mining is expected to improve in this district. During 1914 a score of gold mines within a radius of six miles of this place, equipped with 5 to 20-stamp mills and having large quantities of ore available, suspended work. Most of the operators took up the mining of chrome, copper, manganese, and quicksilver on the basis of war prices. Many of them will now probably resume gold mining.

An important suit was recently started in Josephine county by Harry Kelly, involving $200,000, against R. J. Rowen and the California Chrome Co. The complaint alleges that during Kelly's absence in California his interests in valuable chrome properties in the Waldo district, which have since produced 4000 tons of chrome and sold to the California Chrome Co. at $50 per ton, were conveyed to R. J. Rowen and others. Kelly alleges that the deed was a forgery, and the notary public, a local official, whose name and seal appears on the document, says that he never saw Kelly and never took any such acknowledgment.

A carload of machinery from California is being erected on the Copper Lode mine near Buncom, in the upper Applegate district. The owners are Charles Lillie of Los Angeles, and W. N. Campbell, F. C. Clark, and E. W. Liljegram of Medford, Oregon. The vein is 5 ft. wide at a depth of 35 feet.

SOUTH DAKOTA

Deadwood.—The Cutting Mining Co. is making extensive plans for continuing development started over a year ago. Several good veins have been opened by tunnels, and work has now started on sinking a shaft. A two-compartment one will be sunk to 500 ft., and the orebodies further explored at depth. The shaft-house is under construction and an electrically-driven compressor and hoist have been purchased, to be installed before 1919. The property adjoins the Homestake on the west, and with the present showing, should be a producer within another year.

Shaft-sinking continues at the Echo property at Maitland, it now being over 100 ft. deep. This will be continued to 300 ft., followed by lateral work. Lead-silver ore is being developed.

Lead.—The State geologist, Freeman Ward, has just issued a bulletin on the 'Possibilities of Oil and Gas in Harding County, South Dakota.' In summarizing his findings, Mr. Ward says: "It is believed that there is a reasonable chance of striking gas (and possibly oil) in the county. The most favorable places for putting down holes are on the Glendive anticline and the smaller anticlines in the adjoining areas, one of which has already been located." Harding county is in the north-western part of the State, and the greater part of the area is underlain by deposits of lignite. The possibilities of finding oil and gas will no doubt lead to the drilling of wells. In addition to this county there are oil indications in Fall River county in the vicinity of Ardmore. Drilling has been done there for some time, but as yet the holes have not gained a sufficient depth to prove the field.

TEXAS

Matagorda.—It is stated that J. T. Robison, State Land Commissioner, who has just returned from the property of the Texas Gulf Sulphur Co., situated on the coast, near this place, that the prospect holes went through a solid deposit of sulphur 122 ft. thick. The product analyzed 98% S. The company has expended up to this time more than $1,500,000 on equipment.

UTAH

Alta.—The Michigan-Utah is to extend its aerial tram in time for next season's ore movement. This tram has been operated for some years, carrying ore from the mine to Tanner's flat, a distance of 4½ miles. Its capacity is 100 tons, while the length will be added to by 3½ miles to Wasatch on the Salt Lake and Alta Railroad. The ore contains lead and silver.

American Fork.—The American Consolidated Mines Co., which operates the Earl Eagle and Bog mines, has the tunnel at the former in over 2000 ft. High-grade copper stringers are coming into the face. At the Bog the tunnel is in 600 ft., and the orebody opened above is expected to be cut soon. One shipment assayed 13.81% silver, 80 cents gold, and 8.1% lead.

Cisco.—According to James McWilliams, a well-known prospector, the La Sal district in Grand county, 38 miles south of Cisco, is worthy of exploration. The ores carry copper, gold, and silver, and some uranium.

Cove Fort.—The Utah Sulphur Co., operating in Beaver county, and controlled by M. P. Morrissey, expects to start its new plant about mid-December. It has a capacity of 75 tons of sulphur daily. A great deal of preparatory work has been done this year, in a district inactive for many years.

Eureka.—The Centennial-Eureka company will probably follow the good ore opened at 1900 ft., to below water-level. A winze is already down 40 ft., where water was reached.

Park City.—The Thayne Canyon mill of the Silver King Consolidated is concentrating ore from No. 2 shaft, where a large tonnage is available between 200 and 300 ft. The plant dresses 150 tons of lead-silver-zinc-gold ore daily.

CANADA

British Columbia

Atlin.—Development of the Alexander mine, reputed to be a rich free-milling gold property, is likely to be retarded as a result of the death of its owner, James Alexander, who with his wife was drowned when the steamer 'Sophia' foundered in Lynn canal a short time ago. Who owns the Alexander? That is the question which has been raised since the disaster. Some litigation might result. No will has been found, and A. J. Smith of Philadelphia claims that he is heir to the estate, as he advanced considerable sums of money to Alexander while developing the mine. M. B. Fairlie, manager of the Mining Corporation of Canada, operating at Cobalt, Ontario, and F. G. Stevens, an engineer with the same company, recently inspected the Engineer mine.

Kaslo.—A survey of the manganese deposits of this district has been issued by the Mines Department at Ottawa. Three claims—the Harp, Collingwood, and Black Diamond—are 5 miles from town at 2690 ft. elevation, on the northeast side of the valley of Kaslo creek. The secondary deposits of manganese occurring on the valley terraces and slopes flanking the Kaslo volcanic area of the Blue Ridge are the most noteworthy yet discovered in British Columbia. The ore consists of different forms of wad or bog manganese. A sample of this material proved to be a good grade of wad, containing 48.14% of manganese and 1.65% iron.

Sandon.—The Silversmith Mines' new mill that started work early in October, yielded lead-silver and zinc concentrates worth $82,000. Some crude ore was also dispatched. The profit was $62,000 for the past two months.

Trail—Consolidated M. & S. Co. pays a dividend of 2½% on January 2. This makes 10% for the year.

Obituary

Pierre de Puyster Ricketts died on November 20 at his home in New York. He was just 70 years old. For 32 years he was identified with the Columbia School of Mines as professor of chemistry and assaying. He resigned in 1900 in order to engage in consulting practice under the firm name of Ricketts & Banks. In 1876 he published a textbook entitled 'Notes on Assaying'.

Harry P. Corliss, chemical and metallurgical engineer with the Metals Recovery Co., died on November 16 at the age of 32 years, at Ray, Arizona. His death was the result of pneumonia following influenza. In 1910 Dr. Corliss received the degree of Bachelor of Science in chemical engineering from the New Hampshire State College. He then continued his studies at the University of Toronto for two years, specializing in physical and organic chemistry. At the end of that time he accepted a position as Industrial Fellow in the Mellon Institute of Industrial Research, at Pittsburgh, Pennsylvania. In 1913 he received the degree of Doctor of Philosophy from the University of Pittsburgh. His work at the Mellon Institute extended over a period of five years. During most of this time he was engaged in research upon metallurgical problems. The research resulted in several important improvements upon the flotation process for the recovery of minerals. Perhaps his most notable contribution to this industry was his discovery of alphanaphthylamine as a flotation agent. It is too early as yet to estimate the full value of this discovery to the metallurgical world, but the results already obtained justify the belief that Dr. Corliss' work will one day be recognized as of the first importance in this field. In 1917 he accepted a position with the Metals Recovery Co. in order to initiate the large-scale application of his discoveries. In this work he was uniformly successful and was rapidly making for himself an enviable reputation as a metallurgical engineer when death called him.—C. L. P.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

F. L. Cole is at Washington.

H. Hardy Smith has arrived in London from Korea.

B. Read, recently in the Army, has returned to Oakland.

C. H. Munro has returned to San Francisco from New York.

W. H. Seamon is now manager of the Richmond basin group of mines near Globe, Arizona.

B. M. Snyder has returned from Pearce, Arizona, and is at Los Angeles, with offices at 219 Security building.

Arthur J. Hoskin has returned to Denver from Montana, where he completed the erection of an oil-shale plant.

H. W. Faulkner, superintendent of the Pacific Coast Borax Co.'s mines at Ryan, was in San Francisco this week.

J. C. Scales has established a branch office at Salt Lake City for the Mines Efficiency Co. of Duluth, Minnesota.

Joseph P. Hodgson succeeds **M. H. McLean** as general manager of the Morenci branch of the Phelps Dodge Corporation.

A. L. Larsen, until recently draftsman for the Consolidated Mining & Smelting Co. at Trail, B. C., is leaving for San Francisco, California.

H. E. Eye, manager of the Sasco plant of the A. S. & R. Co., has been placed in charge of the same company's smelter at Hayden, also in Arizona.

S. G. Blaylock, assistant general manager for the Consolidated Mining & Smelting Co. of Canada, has returned from a business trip to the East.

Norman Carmichael, manager for the Arizona Copper Co. at Clifton, has been elected governor of the Arizona Chapter of the American Mining Congress.

A. S. Wheler has been invalided out of the British Army after 18 months service with the 170th Tunnelling Company. He expects to go to China shortly.

C. F. Dyke, manager and part owner of the Montreal mine at Douthat, Oklahoma, has been chosen to be the head of the Tri-State Safety and Sanitation Association for the coming year.

W. B. Thompson has resigned from the presidency of the Inspiration Consolidated Copper Co. and is succeeded by **C. F. Kelley**, the president of the Anaconda Copper Mining Company.

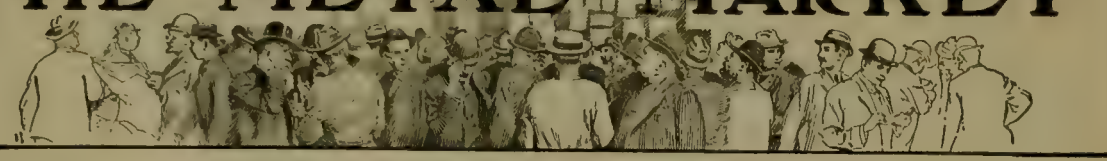
Louis D. Ricketts addressed the local section of the A. I. M. E. on December 10 and gave a deeply interesting description of operations at the Inspiration and New Cornelia mines illustrated by a cinema-film.

O. Wiser has resigned his position as assistant superintendent of mills for the Chino Copper Co., at Hurley, New Mexico, to assume the active management of the Republic Mining & Milling Co., at Hanover, New Mexico.

Leslie Urquhart has been appointed British Agent for Supplies to the people of Siberia. This is a relief measure. Three ship-loads of boots, clothing, cotton goods, and other first necessaries have started. Others are to follow. **J. P. B. Webster** sailed on the 'Ecuador' on the 10th to represent him in Siberia.

E. Gybbon Spilsbury has been appointed to represent the American Institute of Mining Engineers at the Engineering Congress in Paris. The delegation from the United States, invited by the French government, is composed of members of the four national engineering societies. The delegation sailed on December 5 and expects to be away about six weeks.

THE METAL MARKET



METAL PRICES

San Francisco, December 10

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	10.00
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	7.30— 7.80
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$120
Spelter, cents per pound	10.50
Zinc-dust, cents per pound	16.00

ORE PRICES

December 10

Chrome, no definite quotations available.

Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton ..... $22—$30

Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29) ..... $0.86—$1.30

Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29) ..... $1.01—$1.45

(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)

Molybdenite, per lb., 90% MoS_2 ..... $0.75—$1.00

Pyrite, per unit of sulphur, cents ..... 28—32

Tungsten, 60% WO_3, per unit ..... $17—$23

The South Dakota School of Mines at Rapid City has just issued Bulletin No. 12 of 264 pages, entitled 'The Occurrence, Chemistry, Metallurgy, and Uses of Tungsten', by J. J. Runner and M. L. Hartmann. This is probably the most complete work on the mineral, and may be secured by writing to the address given.

EASTERN METAL MARKET

(By wire from New York)

December 10.—Copper is unchanged. Lead is quiet and easy; re-sale metal is 6.75c. Spelter is dull though steady.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government fixed its maximum at 49½ pence, on September 2, but on November 12 this was changed to 48¾ pence, due to a drop in price.

Date	New York.	London	Average week ending	
Dec. 4	101.12	48.75	Oct. 29	101.12
" 5	101.12	48.75	Nov. 4	101.12
" 6	101.12	48.75	" 12	101.12
" 7	101.12	48.75	" 19	101.12
" 8 Sunday			" 26	101.12
" 9	101.12	48.75	Dec. 3	101.12
" 10	101.12	48.75	" 10	101.12

Monthly averages

	1916	1917	1918		1916	1917	1918
Jan.	56.76	75.14	88.72	July	63.06	78.92	99.62
Feb.	56.74	77.54	85.79	Aug.	66.07	85.40	100.31

May	74.27	74.61	99.50	Nov.	71.60	85.97	101.12
June	65.04	76.44	99.50	Dec.	75.70	85.97	....

Reduced rates of war risk insurance caused a fall in the London price. After remaining no less than 71 successive working days at 49½, the quotation fell ¾ d. on the 12th to 48¾ d. The official maximum has been fixed by the British Treasury at this figure, according to Samuel Montagu & Co. The Shanghai exchange rate is easier. The Indian currency returns show a substantial advance in the holding of silver. On the 7th the total, 3109 lacs ($99,488,000), was the highest since December 15, 1915, when 3114 lacs were recorded. The note issue, however, has more than doubled since that date.

TIN

Prices in New York, in cents per pound. The monthly averages in 1918 are nominal. Under the new international agreement, the United States is to get 66% of the world's supply of tin. On December 3 the War Industries Board fixed the price to consumers and jobbers at 72½c. f.o.b. Chicago and Eastern points, and 71¼c. on the Pacific Coast.

Monthly averages

	1916	1917	1918		1916	1917	1918

June	42.07	61.93	91.00	Dec.	42.55	85.00	....

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, which have since been extended to January 1, 1919, prices to be effective on the day of shipment, not the day of sale. Quotations in cents per pound are as under:

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

The price scheduled for second-grade concentrate in the Tri-State region of Missouri-Oklahoma-Kansas is 'off'. Producers found that only 50% of the smelters could be 'lined-up', while the former could get 72% together.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefore $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

The Cassel Cyanide Co. of Glasgow, Scotland, pays a dividend of two shillings (24 cents) per share on December 23. This is equal to £70,500 ($336,000) and makes £105,750 ($508,000) for the year. This is at the rate of 60%.

Eastern Metal Market

New York, December 4.

The markets are still largely controlled, though each week brings indications of relaxation that will develop into free markets.

Copper will continue unchanged probably until January 1.

Tin is under control with the fixed prices announced on the third.

The maximum price of lead has been decidedly reduced.

Zinc is dull, but steady and firm.

Antimony is unchanged.

The trend of events seems to point to a free market in pig-iron and steel after January 1. Sentiment in favor of continuing Government control of prices of these after December 31 has steadily diminished. A conference between steel-makers and the War Industries Board on the 11th will probably result in an end to price-fixing. Buying to satisfy long-restrained wants finds the steel trade skeptical of the ability of such demand to cope with the situation soon to be met. The country's steel mills are still engaged on war work to a large extent. Actual export business put through is not large, though inquiry is ample. British export prices are $15 to $20 per ton above official prices here for heavy products. Prices so far realized here in small export orders are higher than the fixed maximum domestic prices, but are lower than the British.

Pig-iron output in November again declined; it was 3,354,074 tons, or 111,802 tons per day, compared with 3,486,941 tons in October, or 112,482 tons per day.

COPPER

Opinion in the trade leans to the probability that an open market will prevail after January 1, until which time the price is fixed at 26c. This may not turn out to be the case. There are many factors affecting a decision, prominent among which is that of labor's compensation. The matter will probably be decided in the next week or two. Consumers are not making inquiries until the situation is cleared up. Considerable has been heard about cancellations, but it develops that no such thing is recognized by copper producers, a sale being a sale for all time. This factor has therefore not entered into the situation. So far as re-sale of electrolytic or Lake copper are concerned, such metal was sold to consumers with the understanding that it was to be used by said consumers and not to be re-sold at any price. It is probable there has been little if any such re-selling. Casting copper continues to decline and is now quoted at 23 to 23.50c. per lb. It is made largely from scrap copper, which is now plentiful.

TIN

The long-expected announcement of a fixed price for tin, brought under international control, has at last been made. It came out on Tuesday, the 3rd. According to this announcement, which comes from the War Industries Board, the U. S. Steel Products Co. is authorized to offer pig-tin, allocated by the Inter-Allied Tin Executive to that company for distribution at cost to consumers, jobbers, and dealers in the United States holding purchase licenses from the Board, at 72.50c. per lb., ex-dock or port of New York or Chicago, or f.o.b. delivery points at Chicago and points East; and at 71.25c. per lb. ex-dock or store Pacific ports, both at sellers' option. These prices are for shipment in the months of December and January, sales being confined to lots of 25 long tons and over in one purchase. Consumers, dealers, and jobbers may purchase in lots of not less than 25 tons. Dealers may re-sell in lots of 5 tons and over to consumers and jobbers holding purchase licenses from the Board, at a gross profit not exceeding 2½%, whereas in the case of jobbers such re-sales may be made at a profit not to exceed 5%. The regulations prohibiting the sale of tin by consumers are to be strictly enforced. Only Straits and Australian tin have been allowed. Up to today re-sale lots of tin have been sold down to 70.50c. per lb., New York, for prompt shipment. An interesting fact is that Australian tin was offered in the last week at 63c., San Francisco, but its importation is prohibited except by the United States Steel Products Co. The November arrivals of tin were the lowest in months at only 2300 gross tons, of which 2245 tons came through Pacific ports. Average deliveries in the 10 previous months has been 5191 tons per month.

LEAD

The totally unexpected has happened: On Monday, December 2, the Lead Producers' Committee announced a drastic cut in the agreed price of lead, of 1c. per lb. The quotation now stands at 6.75c., St. Louis, or 7.05c., New York. It had been supposed that supplies were small and that the market would advance rather than otherwise, especially if left to itself. Last week the London market for lead was made an open one, and at once the price advanced £11 per ton. Possibly there have been cancellations of Government contracts, rendering the supply larger. The control of this market being a voluntary one and not by Government mandate, makes this reduction all the more significant. In the opinion of some, it foreshadows lower copper prices. New business in lead is light.

ZINC

The market is quiet but steady. Demand is not quite as heavy as recently, but it continues fair, largely from galvanizers. The quotation for prime Western for early or December delivery is 8.25c., St. Louis, or 8.60c., New York, with prompt held at 8.40c., St. Louis, or 8.75c., New York. The quotation for first quarter is about 8c., St. Louis, or 8.35c., New York. One dealer quotes 8.12½c., St. Louis, for prime Western for December delivery. The weekly Government report of stocks and output for the week ended November 23 shows each to have increased a little more than 600 tons.

ANTIMONY

The market is quiet at 8.50 to 8.75c., New York, duty paid, for wholesale lots for early delivery.

ALUMINUM

Government maximum prices continue unchanged for No. 1 virgin metal and for scrap at 33c. per lb. for 50-ton lots, 33.10c., per lb. for 15 to 50-ton lots, and 33-20c. per lb. for 1 to 15-ton lots. It is understood that more material is available for domestic uses.

ORES

Tungsten: There has been no change. Stabilizing the market is being considered at Atlantic City by a committee of the industry in conference with Van H. Manning, director of the U. S. Bureau of Mines. High-grade ores are quoted nominally at $21 to $23 per unit, with the low grades from $17 to $18. The ferro-tungsten market has not been tested recently.

Molybdenite: The market is dull, and prices are nominal at 75c. to $1 per lb. of 90% material. A sale of 80% concentrate is reported at 87½c. per pound.

Manganses Alloys: Re-sale ferro has appeared at $240 per ton, delivered, while spiegeleisen up to the 22% grade can be bought at $70, furnace. Demand for both continues insignificant.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

MONORAIL ORE-HAULAGE

*What is said to be the first successful monorail system in the United States is now in experimental operation at the Highland-Surprise mine, on Pine creek, Coeur d'Alene region, Idaho. The trial has caused much local interest, and operators say that the system will completely solve the transportation problems that have been so vexatious in the past. The track as now operated is 1000 ft. long over a 10% grade leading down the creek from above the mill. Equipped with a 20-hp. Ford engine, and loaded with three tons, the car is said to attain a speed of 18 miles an hour on the up-grade. Four or five trailers are attached to each train, giving a total capacity of 12 to 15 tons. The most important feature of the system is the cheapness of construction. Grading is entirely dispensed with, and unevenness in contour is overcome by the height of the posts supporting the track. The cost of upkeep is therefore practically negligible, while 1000 ft. of track can easily be built in a day under ordinary conditions. Grades of from 10 to 15% can be negotiated without difficulty, and the inventor claims that the cost of construction over average Coeur d'Alene mountain routes will run from $3000 to $4000 per mile. The accompanying photograph shows the system fully. Either gasoline or electric power can be used, and it is said that one man can attend to haulage of from 100 to 300 tons per day over a distance of several miles at a low cost. Track may be economically constructed during the winter. Only two sizes of timbers are used, and posts can be made of such lengths as to place track above all possibility of snow troubles. The load is carried on both sides of the car and below the rail. For carrying ore, special side-dumping pockets are provided.

MONORAIL ALONG PINE CREEK, COEUR D'ALENE, IDAHO.

The inventor is W. H. Sheppard, who has resided in Seattle for 18 years and who has devoted the past seven years to perfection of the system. Some time ago he brought his idea to the attention of W. W. Papesh, president of the Highland-Surprise Mining Co., who provided the capital to construct the short track now in operation. The first trials were so satisfactory that the Highland-Surprise has concluded to extend the line to Masonia, the settlement three miles below the mine on the line of the branch road of the O.-W. R. & N. Co., now being constructed up Pine creek.

While monorail systems are in successful use in Europe, no serious attempt has previously been made to apply them to ore transport in mountain regions. The Monorail Transit Co. of Seattle, Washington, makes this plant.

*Excerpt from 'Northwest Mining Truth', Spokane, Washington.

A NEW RESEARCH BUILDING

The Westinghouse Electric & Manufacturing Co.'s new research building at East Pittsburgh, Pennsylvania, is about a mile from the works on the Lincoln highway. Architecturally, the building is plain but substantial, of reinforced concrete and brick, trimmed with white terra-cotta. The distinctive features of the building are its plumbing and wire services, being arranged in such a way as to enable these services to be brought into any particular laboratory when needed without disturbing any other part of the building. The research organization was founded in 1906.

The manufacture of electric machinery and apparatus is one of the most intricate and complicated in industry, and is characterized as being in a state of constant improvement and progress. New problems requiring special research work are continually confronting the engineers. Provision is made in the new building to deal with a large variety of experiments in many lines of work, including magnetic insulation, metallographic metallurgy, organic and inorganic chemistry, furnace combustion, wood-working, illumination, glass-blowing, etc.

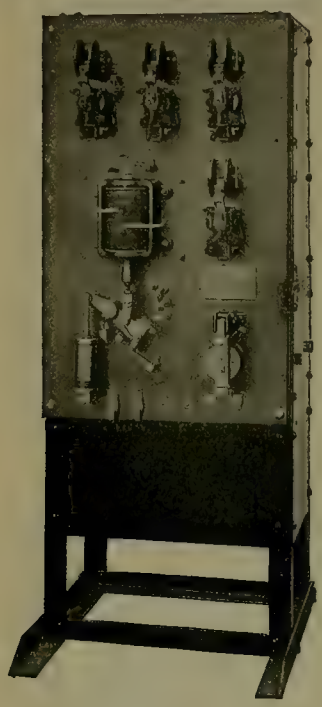
The power-house contains motor-generator sets for one, two, or three-phase currents, an air-compressor, vacuum-pump supplies, liquid-air machine, storage-battery in the basement of the power-house, electric-furnaces of various types, together with the necessary control for melting, annealing, and various metallurgical processes.

MINE-DUTY STARTERS

On account of the injurious effect of moisture in mines, and the severe operating conditions, special care should be used in the selection of motor-starters and controllers, particularly those for ventilating-fans and pump motors, as in most mines these must be kept in continuous operation. Another condition that affects the operation of motor-starters is the wide fluctuations in generator or line-voltage caused by mine hoists and locomotives. For these reasons the standard design of hand or automatic starter will not operate satisfactorily, and a starter should be selected that is especially adapted to operate under such conditions.

The accompanying illustration shows a mine-duty self-starter, manufactured by the Cutler-Hammer Mfg. Co. of Milwaukee. This apparatus has recently been re-designed, and embodies several operating and protective features essential to the continuous operation of a fan or pump motor.

Plain hand-starters and starters without self-resetting features will drop to the 'off' position every time a large drop in voltage occurs; this of course stops the motors controlled by them and serious results may follow. When a motor receives current at a voltage considerably lower than its rated potential it will slow down, and stop when this voltage drops to a certain value or when the current is 'off'. Control apparatus is required that will automatically ensure the continuous running of the pumps and fans, even if at reduced speeds, also to re-start them after a complete interruption and subsequent resumption of current supply.



MAGNETIC SWITCH TYPE OF MINE-DUTY STARTER.

To meet these conditions the starter illustrated, which is a pilot-switch accelerator type of motor up to 100 hp., is fitted with a rugged relay which is very sensitive in its action. This relay guards against injury to the motor; it causes all of the armature resistance to be inserted in case of a bad drop in voltage, thus checking the heavy current resulting from the decreasing counter electro-motive force. If the line-pressure falls to about 80% of the normal the relay drops out, opening the control-circuits to the accelerating switches that drop in turn and cut into circuit the heavy-duty starting resistance, which has capacity for continuous service at low voltage. The motor then runs at slow speed until the voltage increases, and at 90% of normal the relay pulls in again, cutting out the resistance and permitting the motor to accelerate to normal full speed.

A single coil overload, where shunt-wound motors are used, can be added to also insert the armature resistance in case of an overload and thus keep the fan or pump going at a reduced speed. This single-coil overload and the voltage relay prevent the shunt motor from flashing over under severe voltage fluctuations. When the voltage drops to a very low value, the motor tends to run as a generator and is liable to 'flash over' across the brushes, injuring the motor and commutator. With a compound motor the overload is not so necessary, because when the motor tends to run as a generator the compound winding opposes the shunt winding, neutralizing the field and preventing those conditions which result in 'flashing over'.

NOTES ON A 2-TON ELECTRIC-FURNACE

An electric-furnace, whose main product is nichrome, the well-known high-temperature resisting alloy, has recently been erected at the plant of the Driver-Harris Co., Harrison, N. J. The furnace is of special interest because of its electric equipment, which is an excellent example of modern practice. Alloys of various composition are also made in the furnace, which is of the 2-ton Heroult arc type, with automatic regulation.

During a run on 3000 lb. of nichrome and on a high nickel steel the amount of power taken at the start of the heat is small in both cases; but as the resistance of the furnace-circuit decreases, owing to the heating-up of the electrodes and the consolidation of the charge, the power consumption rapidly increases until stable conditions are reached. The average amount of power consumed is then held practically constant by an automatic regulator, with the exception of a slight continuous increase due probably to a corresponding decrease in the resistance of the furnace circuit. There is, however, no uniformity in the actual power consumption. As the charge melts, pieces of metal fall in between the electrodes and establish short circuits. For the most part these short circuits are only momentary, as the fragments causing them are promptly melted, but occasionally they persist and then the automatic regulator draws up the electrodes until they are clear. This process sometimes breaks the arc, and then there is a sudden decrease in the power consumption until the regulator brings the electrodes down again and re-establishes the arc. As would be expected the nickel-steel alloy shows more of these irregularities than the softer nichrome. Toward the end of the run there is a marked change in power consumption, when the metal is given a special treatment before pouring. In the case of the nickel-steel a higher temperature was necessary, perhaps to lower the carbon content, while with nichrome the temperature was lowered. The temperature of the furnace averages 2200° F.

High momentary overloads are characteristic of electric-furnace work, and make it much different from ordinary power service.

At the Driver-Harris plant one of the most interesting features is the Thury regulator, which automatically maintains an approximately constant current at the furnace electrodes. Without this device the current consumption would vary eratically, even if an operator were constantly endeavoring to correct the variations. This apparatus saves labor and current, reduces to a minimum the time required to prepare a charge, and by providing uniform conditions, keeps the quality of the product uniform.

Each furnace electrode has a separate regulating mechanism, and a raising and lowering motor. The regulator can be set for any desired current value and when this value is exceeded, each regulating mechanism closes a contact momentarily which causes the motors to raise the electrodes slightly. The contacts continue to close at brief intervals until the electrodes are drawn up high enough to reduce the current to the pre-determined value, the intermittent action being employed to prevent the electrodes from being raised too high and thus causing an unstable condition. When the current falls below the pre-determined value the electrodes are lowered in a similar manner. The regulator itself is controlled by a solenoid energized by means of current from series transformers in the main high-tension circuit. Damping devices prevent the regulator from acting on overloads that immediately correct themselves. In addition to the automatic device, each electrode motor has a drum controller for manual operation.

When the charge is finished, the whole furnace is tilted bodily for pouring. This tilting is effected by an 11-hp. alternating-current slip-ring motor, working in a pit beneath the furnace and geared to the tilting mechanism. It has a drum controller by the side of the furnace. All of the equipment consists of standard Westinghouse Electric & Mfg. Co.'s furnace apparatus.

SIMPLEX FLOTATION MACHINES

ARE THE SIMPLEST AND MOST EFFICIENT

There are no pulleys, shafting, belts, propellers, mats, blowers, or wearing parts. The repairs, maintenance, power and labor charge is much lower than is possible with the more complex equipment.

The method of agitation is by a patented hydraulic system which produces a perfect mixture of ore and flotation medium. The result is an exceptionally high extraction of the mineral content of the ore.

These are a few of the reasons why Simplex Flotation Machines are being used by most of the mills in the graphite districts of Alabama.

THE W. O. ARZINGER MACHINERY COMPANY

NASHVILLE, TENN.

Simplex Equipment is not an experiment. It has demonstrated its superiority in numerous mills where it is in successful operation. It has proved itself a real step forward in flotation practice.

Entered at the San Francisco post-office as second-class matter.

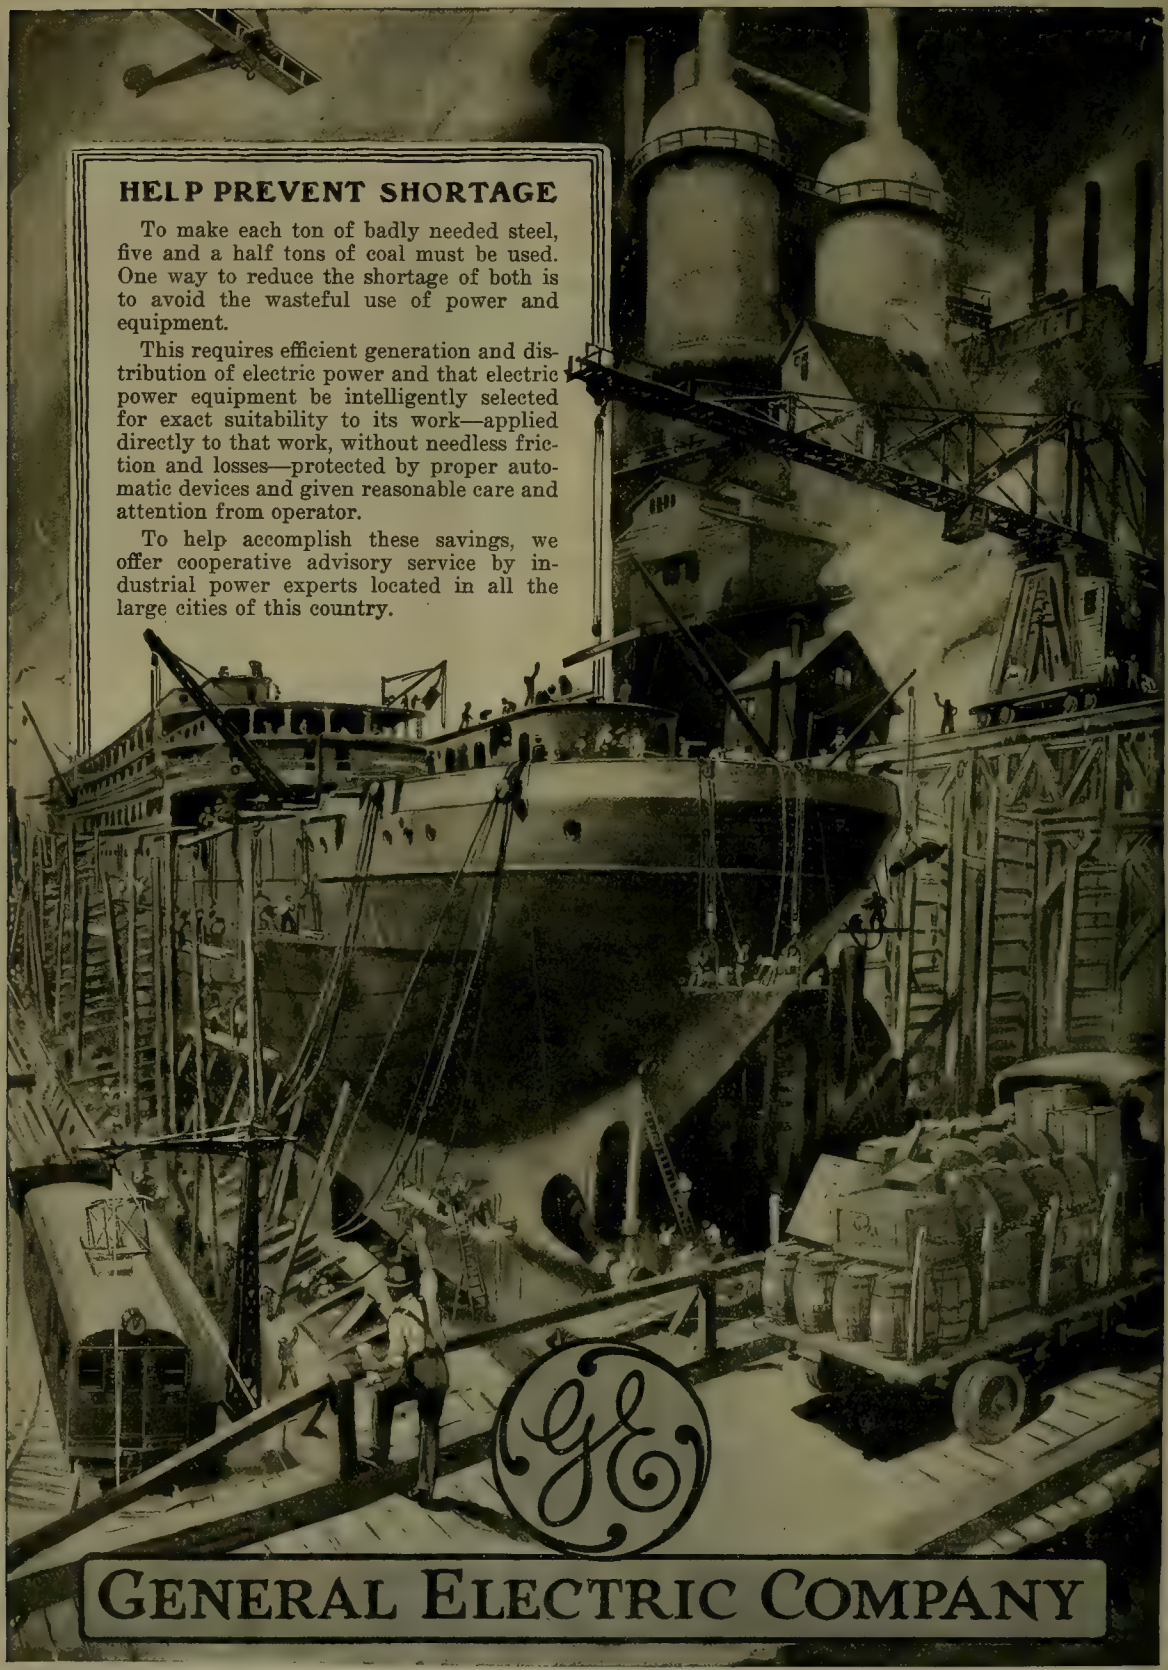
Branch Offices—Chicago, 600 Fisher Bdg.; New York, 3514 Woolworth Bdg.; London, 724 Salisbury House, E.C.
Price, 15 cents per copy. Annual subscription, payable in advance; United States and Mexico, $4; Canada, $5; other countries in postal union, 25s. or $6.



HELP PREVENT SHORTAGE
To make each ton of badly needed steel, five and a half tons of coal must be used. One way to reduce the shortage of both is to avoid the wasteful use of power and equipment.
This requires efficient generation and distribution of electric power and that electric power equipment be intelligently selected for exact suitability to its work—applied directly to that work, without needless friction and losses—protected by proper automatic devices and given reasonable care and attention from operator.
To help accomplish these savings, we offer cooperative advisory service by industrial power experts located in all the large cities of this country.

EDITORIAL

SENATE Joint Resolution 156, for extending the period of exemption work on mining claims, is on the docket of the House of Representatives. It is hoped that it will be passed, but this is doubtful.

EXPANSION of mining in California is indicated by the fact that whereas in 1887 the output of gold from the mines of the State represented three-fourths of the total mineral production, and almost a half in 1907, it constituted only one-eighth the entire production in 1917. Last year 54 different mineral substances were mined and marketed. So says the State Mining Bureau, which is making a sincere and successful effort to aid and stimulate the exploitation of California's mineral resources.

IT is estimated that 300,000—possibly 350,000—persons have died of influenza in the United States, as compared with 260,000 casualties and 36,000 deaths in the War. The loss to the profession from the epidemic is incomparably greater than from the War. We regret deeply to have had to record the untimely ending of many promising careers, notably O. F. Ambur, H. P. Corliss, B. H. Dosenbach, Howard Du Bois, Robert M. Green, Frederick A. Hale, Jr., Howard S. Lee, J. J. Morrison, O. T. Storrs, W. A. B. Walling, C. A. Waring, and C. A. Wheeler.

RIGHTS to the use of water struck in the course of mining work is the subject of a letter from Mr. G. A. Duncan. He touches upon the distinction between 'percolating' and 'flowing' water. On this difficult question the courts have held that water issuing from a mine is not a watercourse and therefore is not subject to the law of appropriation. If, however, it flows in a definite channel underground it becomes subject to the same laws as water that flows in a channel on the surface. The definition of stream-water has been expanded in several cases, as in that of the Los Angeles water-works, in which instance the water was gravitative and was drawn from a channel in the San Fernando valley. If water runs in a definite channel it is not percolating water, which is subterranean water saturating a plane without definite source or channel. At Ely a steady flow of water issues from the limestone; this is unquestionably an underground river. There remains a twilight zone of meaning between 'percolating' and 'flowing'; and on this the courts have yet to adjudicate in special cases.

GERMAN duplicity of a familiar kind is illustrated humorously by the statement of Von Eckhardt, the German minister at Mexico City, in explanation of the decoration of buildings in that city with German flags on November 11. He said that it was done "to show their satisfaction that their country had given peace to the world." By the way, it is noteworthy that William Bayard Hale, the Hearst journalist who was retained, at $15,000 per annum, as a propagandist by the German bureau directed by Dr. Bernhard Dernburg, was sent by President Wilson to investigate conditions in Mexico shortly before the War. One can imagine how he colored his report to suit the policy of his friends at Berlin.

LAST week the local section of the Institute spent a most enjoyable evening, thanks to Dr. L. D. Ricketts, who exhibited and described cinematic films illustrating mining and metallurgical operations by the Inspiration Consolidated and New Cornelia copper companies at Miami and Ajo, respectively. It was amusing to note how the film by its rapid motion gave the illusion of feverish activity on the part of the workmen. In the same way, the speed at which the Marcy mills were made to revolve suggested an expensive, and even dangerous, operation, as compared with the slow and comfortable gait at which these machines actually turn. The big tailing-excavator at Ajo made an impressive picture; when the whole machine, with its trestle and housing, was moving it looked as if the entire plant was being shifted to suit the excavator, instead of the reverse. Dr. Ricketts referred to "the constant error in sampling"—the error made in assuming that ore can be broken on a large scale, by the caving system, for example, as cleanly as in moil-sampling or in churn-drilling. He mentions another interesting point, namely, the fact that part of the 'unaccountable loss' at a smelter is due to 'dusting', so that it has proved advisable to enclose the mixing-beds and to avoid the dropping or other movement of ore in the open air. At the Inspiration 12½ million dollars, including $2,000,000 expended on the International smelter, was spent before the investors

were assured of the success of their enterprise, this fact indicating the enormous capital expenditure required to place a low-grade copper undertaking on its feet. It only remains to add that Dr. Ricketts' kindness in making the exhibit was keenly appreciated, because it involved not only money, which is cheap, but personal inconvenience and trouble, which are dear.

ANACONDA'S position in the world of mining is being steadily aggrandized by its purchase of stock in other large enterprises. In 1915 the Anaconda Copper Mining Company acquired 150,000 shares in the Inspiration Consolidated Copper Company and 30,800 shares in the Greene-Cananea Company. By the end of 1917 its holdings had been increased to 250,900 shares of Inspiration and 56,600 shares of Greene. It is reported that Mr. William B. Thompson's holding of Inspiration stock was sold on the market some time ago; this would explain his resignation of the presidency of the Inspiration company and the election of Mr. C. F. Kelley, who has been acting as president of the Anaconda during Mr. John D. Ryan's devotion to war-work. The aggregate output of copper made by the three companies mentioned amounts to the magnificent total of 420 million pounds per annum. While we are always inclined to regret the extension of control over a multiplicity of enterprises, because efficiency is not increased and moral responsibility is usually decreased after a company's operations have reached beyond the magnitude favorable to economic work, we recognize that the Anaconda management has been marked by an enlightened spirit and that if any company is to be aggrandized in this way then the Anaconda is the one least likely to abuse its power as a controller of industry.

THE suggested fixation of gold at a higher price, as, for example, by the Government paying a bounty on new gold, has been regarded by some of our academic friends as a highly dangerous scheme for correcting an abnormally rapid appreciation of the metal; any tampering with the gold standard has seemed to them an economic vandalism. It is interesting therefore to find an article on 'A New Standard Price for Gold' in so conservative a periodical as 'The Nineteenth Century and After'. In this eminently respectable British review Mr. Lancelot Ussher suggests that "the new standard be raised to 50% above the old, that is, somewhere in the neighborhood of the actual present market-price." He is so pleased with the idea that he speaks of it as "my scheme," and he concludes that the success of it "is tantamount to a gift by all the Allies (though it cost them nothing) of hundreds of millions to the United States, since she holds the greater part of the world's gold stock. But judging by her past record of unexampled generosity and open-handedness she will at once throw in the whole of this new found surplus to further the united aims of the Allies." It may have looked like that before the German capitulation, but conditions have changed, and if the United States does anything of the kind now it will be for reasons somewhat different. Mr. Ussher estimates that the natives of India have put away $500,000,000 of gold; he expects that this and other hoards would be induced to emerge from concealment if the standard price were raised. Another interesting statement is that of the Committee on Currency and Foreign Exchange after the War appointed by the British Treasury. In its report this committee says: "It is no secret that the creation of an immense volume of money and the raising of big loans in the foreign countries brought about the suspension of the gold standard." That can be said likewise of conditions in the United States. The committee is of the opinion that "gold is not expected to circulate as currency at any rate for a considerable number of years after the War," but we find no reference to any suggested change in the standard. Reports from similar committees appointed at Washington are due at an early date, and we look forward to giving them to our readers. Meanwhile we take pleasure in publishing further letters on the subject in our Discussion department.

A League of Nations

It is a parochial mind that is not keenly alive to the vital interest of the great subject that is uppermost at this time. We talk and dream of ending war. Our Allies in Europe approach the subject physically tired but morally exalted by the tragic experience of the four long years through which they have fought to the crowning triumph of November 11. The United States does not know the feeling of physical weariness but is likewise exalted morally by her participation in the struggle and by the honorable part played by her armies in the concluding battles of the Great War. The thinking part of the American people therefore is alert to the significance of this crisis in world politics. We face the most tremendous problem that has ever confronted civilized mankind. Unless the nations agree to ensure peace, they perish. The underlying idea is that the further development of scientific warfare, as shown by the testimony of recent events, will be such as to render another Armageddon a suicide of the human race. The elaboration of poisonous gassing, the extension of long-range artillery fire, the multiplication of submarine assassination are among the obvious contingencies, but worst of all is the development of aerial bombing, such that whole cities may be destroyed before a declaration of war. Mr. Mark Sullivan, in 'Collier's', has written well on the subject, but he makes the mistake of assuming that America is not menaced; that, although Paris or London may be blown to smithereens overnight, New York or Washington will be immune, because 3000 miles of sea intervenes. Such optimism is illogical. The first aeroplane crossed the 20 miles of the English Channel so lately as July 25, 1909; who shall say what the corsairs of the air may not be able to do in 1929? The Atlantic is a moat to military aggression, it may not suffice to protect us from aerial attack ten years

hence. Moreover, as Mr. Sullivan admits, in any future war, as in the one now happily ended, the contestants will appeal to the moral judgment of the United States and this country will be impelled, as in the present case, to support the side that is right, or lose its self-respect. American isolation is a thing of the past, our position today is one of splendid power, moral and material, but with that power goes an equal responsibility. Mr. Samuel Gompers has said truly: "America is more than a country. America is more than a continent. America is more than a name. America is an ideal." The spirit of her participation in the great conflict in Europe has been in accord with that ideal, and no aggressive war meant to subjugate a free people will ever leave her cold to an appeal for succor. We judge the future by the past. Therefore, we insist, the notion that the United States has no immediate interest in the proposed league of nations is a mistake. Next comes the question how to bring about the consummation of the idea for which President Wilson is given the credit of chief sponsor; he has gone to Europe as the leading exponent of the idea and he is believed to be in a position best able to bring it to fulfilment. If his noble purpose should fail, it will be, we believe, owing to the attempt to achieve two discordant aims concurrently. The intention of the Allies, when their representatives meet in conference at Versailles, is to see that Germany and her vassals are punished justly for their colossal crime in starting the War and in waging it with unexampled brutishness. That is one object of the conference; the other is to create a league of nations for preventing the outbreak of another such assault upon civilization. The two aims are incompatible. If Germany—for, in this discussion, we can omit consideration of her dupes—is to be punished for her crime today, can we ask her tomorrow to join in a friendly league to maintain peace? Would you condemn a man one day for behaving like a cad and ask him the next day to join your club? If Germany is treated with a severity such as is advocated, for instance, by Mr. Lloyd George, who wants to make her pay England's cost in the War, how can it be expected that Germany will be in a temper fit for association with the Allies within the time of this generation? Of course, Germany must be punished so condignly as not only to deter her from repeating her crime but also to warn any other power that may be tempted to imitate her monstrous performance; holding firmly to this idea, we deem it a manifest insincerity to expect her to become a loyal colleague with the Allies and the United States in a league to preserve peace. The basis of such a league must be international trust; there can be no confidence in Germany's promises to keep faith, her cynical disregard of solemn covenants is too recent and too damnable. The Germans have been beaten, but they have not changed in character, neither their government nor their people; until Germany has brought forth fruits meet for repentence there can be no reasonable expectation of converting her into a guarantor of international amity. Nor is she needed in that capacity. A league of 23 nations headed by the three great Allies and their great Associate exists already; this league was organized for war against Prussian aggression; it is well able to maintain peace, among other ways, by punishing the outlaw, who has now been defeated and captured. In days to come this defensive partnership may become a peaceful league and eventually it may include among its members a sadder, wiser, and repentant Germany. Until then the hope of civilization rests chiefly on the friendly co-operation of the three leading democracies, England, France, and the United States. They will suffice to keep order. The one unspeakable misfortune that could now ensue would be to create an atmosphere of misunderstanding between the United States and either England or France. A deliberate effort is being made, by German propaganda, to this end; and the difficulties inherent in the settlement of the political legacies of the War afford opportunities for differences of opinion. They can be avoided by separating the two purposes in hand, first, to bring Germany to account, and secondly, to create a league of nations for the preservation of peace.

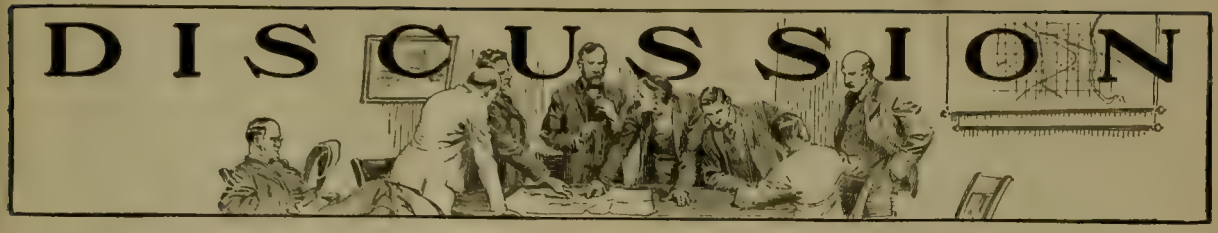
The Outlook

The phrase 'after the war' is not yet applicable to current conditions, we are in the midst of the interval between war and peace called an armistice; whereas actual fighting has ceased, except in odd corners of the map, the preparedness for resumption of war prevents an immediate return to the normal. A legal state of war persists and the special powers given to the Government have not been repealed. It is well that no sudden change in administrative functions is possible, for a complete relaxation of control would involve woeful confusion. Meanwhile the demobilization not only of the armies but of the industries created for purposes of war is proceeding in an orderly way. Much will depend upon the manner in which it is done. Our stock of patience will be subject to large drafts, for most of us are in a hurry to return to the pleasant ways that we connote with the phrase 'before the war', and we shall have to submit to a good deal of official regulation before the spectre of war is finally laid in the sunlight of peace. Those that are engaged in mining will have to suffer from many annoyances and uncertainties before things become as they were, if they are ever quite the same, which is unlikely. They have comported themselves patriotically during the great unpleasantness and they will be reasonable during the process of reconstruction, while on guard against the impositions placed upon them by sundry profiteers whose machinations have been hidden under the dollar halo. The War has shown the difficulty of regulating industry without enlisting the services of those directly interested in the commercial phase of the industry, thereby giving monopolistic groups the opportunity to gather information and to use tactics calculated to strengthen their grip on the small producers of metals. If a state of war had persisted for many years it is possible that the work of

Federal control might have passed by a process of elimination into the hands of men both competent and wholly detached from market influences, but in the rush to secure the supplies of metals needed for munitions it was impossible apparently to prevent such abuses of official power as we have seen in the fixing of prices for chromite and manganese, or the scarcely veiled dictation of the metal agencies in the adjustment of the markets for copper and lead. The only cure for these aberrancies is publicity such as it is difficult to obtain on account of the interplay of politics, finance, and bureaucracy. In the end the inexorable law of supply and demand spoils most of the schemes of the manipulators of markets, except during war-time, of course, when economics are held in abeyance by executive order. The rank and file of the mining community is not at all content with its subjection to the halo-hatted gentlemen at Washington and will be glad when their innings are terminated automatically by the signing of peace. Meanwhile it is to be hoped that some of the blunders made will be rectified during the interval and that pains will be taken not to wreck the various special branches of mineral development that have been created in response to the national need. During the War an intensive effort was made to render the United States independent of foreign supplies of sundry minerals, particularly those required in the making of special kinds of steel, such independence of foreign importation being necessary on account of the use of all our available shipping for expediting the transport of men, munitions, and food to Europe. The miners rose to the occasion and proved that they could find and produce the minerals heretofore obtained in other countries; would it not be a blunder to ignore this demonstration of our resourcefulness and become dependent again upon the foreign sources of supply? This is one of the questions made prominent by the experience of the last twelve or eighteen months, and we hope that it will be considered seriously by our representatives in Congress.

A Merger

The committee appointed to consider the question of uniting or affiliating the Mining and Metallurgical Society of America with the American Institute of Mining Engineers has reported in the affirmative. This committee consists of Messrs. Charles F. Rand, Joseph W. Richards, Robert M. Raymond, and Bradley Stoughton; it has reported that the constitution and by-laws of the two societies indicate that their aims and activities are practically identical, and that almost all the members of the junior society are members of the Institute. Whereas the requirements for membership in the Society used to be more rigid than those of the Institute, the recent changes made by the latter have made the requirements of both equally strict. Another difference, namely, the constitutional provision prohibiting the Institute from taking part in the discussion of public affairs, was removed five years ago. It will be seen, therefore, that the similarity of aims, activities, and membership points at the desirability of a consolidation. That is the opinion of the committee, which recommends that the Society be invited to consolidate with the Institute, with the understanding that any of its members, not now also members of the Institute, be invited to join the older organization; that the local sections of the two organizations be merged; that a bronze tablet be placed in the Members' Room of the Institute to commemorate the Mining and Metallurgical Society; that the directors of the Institute establish an additional committee on Ethics, Welfare, and Public Relations, the membership of such committee to be chosen from those now members of the moribund society. We have every reason to believe that this proposal to merge the two organizations will be put into effect. The bronze tablet is a lovely idea. The Mining and Metallurgical Society during its life failed to render itself worthy of the concluding, and most important, part of its name—"of America". It was born with the idea of being select and it will be buried under the epitaph of being exclusive. No technical society representing the mining and metallurgical profession "of America" could be deemed representative so long as its membership included about 250 men; to suppose even for a minute that only 250 mining engineers, geologists, chemists, and metallurgists in America were worthy of being included within such an organization is to ignore facts and to insult the profession. We estimate that a society so designated should have a membership of 2500, at least, including American mining engineers and metallurgists abroad. The fact is, the Institute has been nondescript and the Society exclusive, one had a tenth of those it might have enrolled, whereas the other had about twice as many as it should have included on the basis of any sort of reasonable selectiveness. Such being their relative positions, it is not surprising that the Society served as a nucleus of criticism and disaffection when the affairs of the Institute went wrong; indeed, the group of members identified with the New York section of the Society constituted the committee of reform that did yeoman service in re-organizing the affairs of the Institute a few years ago. They realized that the Institute was not living up to its full opportunities and that their own organization was growing too slowly to perform the representative functions necessary for the profession and the industry, so they spurred the Institute to a new and successful departure. They were reformers then, but they might have become 'revoltosos' at some future time. The idea of such a small number of men, all members of the Institute, maintaining a separate Society, based on the supposition that they were superior to the rest of a profession numbering thousands, was absurd. It is fitting that the failure of the scheme should be recognized at a time when other reactionary ideas are undergoing burial in the trenches of the battlefield. So we shall be pleased to be present, in spirit, at the obsequies of the 'M. & M.' and hope that the merger with the Institute means that the profession of mining engineering is now prepared to pull together for effective service in the peaceful days in store.



The Gold Problem

The Editor:

Sir—Upon reading the letters by Major Karri-Davies and Mr. F. W. Bradley in your issue of November 9 (for I assume B. W. F. to be a pseudonym for Bradley) I thought I would send you another communication in reply thereto, because you invited "useful discussion" regarding the subject.

The Major says, "it will be observed:

1. That the Government could and did alter the value of coin and that the people accepted the value placed on it by the Government.

2. That the gold standard was fixed (decided upon) on account of its convenience.

3. It was possible to alter the value of gold from time to time arbitrarily to meet conditions then existing. Why not do the same thing now for the same reason?"

He does not seem to understand that all the British government did, in altering the value, was to *change the weight of the metal in the coins* from time to time, which it did "arbitrarily" in its efforts to meet the changing ratio between silver and gold, so that both could serve as money at the same time. He seems to overlook the fact that he had previously quoted from the Act of Parliament, "that the gold coin shall be considered and is hereby declared to be the only legal tender for payment, and no tender of payment of money made in silver coin of any sum exceeding fifty shillings at any one time shall be reputed a tender in law."

Now, if it were possible for the British government to fix or determine arbitrarily the value (I understand that by "value" he means exchange-value or purchasing power) of gold, it could, also, just as readily arbitrarily fix the value of silver; why not? But, as a matter of fact, absolute and incontrovertible, no Government can legislate value, for the simple reason that all exchange-values are relative and they are determined solely by the exigencies of trade and commerce.

Again, the Major, in his brief statement of the history of gold money in England, noted that "each time a change (of weight) was made in the gold coin a new name was given to it," but he seems not to have understood that the reason for changing the name of a coin was that different weights and fineness of metal must, necessarily, receive different names to enable people to understand what was meant when any particular name was used. 'Pound sterling' and 'sovereign', *now*, are used interchangeably because they both mean precisely the same weight of gold; but if they each meant a different weight of gold, or if they meant the same weight of gold but of a different fineness, or if they meant the same weight of different metals, manifestly they could not be used interchangeably. Similarly the words 'price' and 'value' must not be used interchangeably unless they are so qualified or explained that their meaning is unmistakable.

In the ordinary sense, all values are relative, that is, comparative. 'Price' is the value of anything expressed in terms of a certain weight of the standard of value, which is called the unit of exchange-value. Gold is the *standard of exchange-value* in most civilized countries today, but in nearly all of them the unit of exchange-value is a different weight of the standard. That is to say, in England the unit of exchange-value is 113+ grains of fine gold which has been named a 'sovereign'. In the U. S. A. the unit of exchange-value is 23.22 gr. of fine gold, which has been named a 'dollar', and so on for other nations.

A government may and does select its standard of exchange-value and may and does decide upon what weight and fineness of such standard shall constitute its unit of exchange-value; all of which it does "arbitrarily"; but when it comes to determining the worth, exchange-value, or purchasing power of such a weight of such standard of exchange-value, a government has no more power to say what it is worth than you and I and the rest of us, who constitute the nation, have. As before stated, the worth, exchange-value, or purchasing power of such unit of value depends solely upon the exigencies of trade and commerce, within nations and between nations. Furthermore, these units of value and multiples and divisions thereof in the form of coins are the only *real* money of any nation that has adopted metal money. They are its medium of exchange. There is now no real money in circulation in the United States of America because there is no such thing as *paper* money.

If anyone will take the trouble to read the various inscriptions on paper-notes, bank-bills, etc., it will be observed that they are *promises to pay money* and, as long as the people have confidence in the Government, Federal Reserve Banks, National Banks, etc., such paper promises to pay money will pass current as money, at their face-value, but no longer. They are not money *in fact* though they may be included under the general term curren(t)cy', which means both money and paper promises to pay money.

Neither Major Karri-Davies nor Mr. Bradley appear to realize that governments *do not* fix the exchange-value

or purchasing power of gold coins. All that governments do is to fix the weights of gold in the coins and give them names by which they may be identified. "A rose by any other name would smell as sweet"; so also an ounce of gold by any other name, than "85 shillings", or "20.67 dollars", will buy as much. Mr. Bradley, particularly, ought to realize that the gold he gets from his mines now does not buy nearly as much labor and supplies as the same amount of gold would have bought before this war. But this condition of affairs is not due to any legislation, by the Government, which has changed the weight of gold in the coins. In this connection the Major proposes:

"The new standard-value of gold would be fixed by the financial conference of the nations. It might be $40 per ounce or any other figure that the Conference in its wisdom decided; provided it was accepted by the world, the figure would not matter."

There is no such thing as a "standard value of gold", if by "standard value" 'fixed' value is meant. "$40 per ounce" is not a 'fixed' value; it is what is termed a 'mint price' for gold, the word 'price' meaning the exchange-value of anything expressed in terms of a unit of exchange-value. As explained before, all exchange-values are relative or comparative, and, therefore, in expressing the exchange-value of anything it must be expressed in terms of something else. Hence, it is impossible to express the exchange-value of gold in terms of itself.

"$40 per ounce" means, literally, that a 'dollar' is one-fortieth of an ounce and, if a Troy ounce is meant, a 'dollar' will be 12 grains, whether gold or silver or copper or tin or any other metal is selected as the monetary standard. And the exchange-value or monetary value of that particular 'dollar', whether it be gold or silver or copper or tin, will be precisely what 12 grains of gold or silver or copper or tin may be swapped or exchanged for at any particular time and place; for time and place are elements that have bearing upon the determination of the relative exchange-values of gold and silver and copper and tin.

To recapitulate: Webster's dictionary defines money thus: "A piece of metal, as gold, silver, copper, etc., coined or stamped and issued by the sovereign authority as a medium of exchange in financial transactions between citizens and with the Government." Also, in a comprehensive sense, "Any currency usually and lawfully employed in buying and selling". The late Horace White, in 'Money and Banking', defines it as "A commodity which mankind voluntarily accepts in exchange for all other commodities and services."

The 'mint price' of 85 'shillings' or 20.67 'dollars' per ounce for gold means, simply, that a Troy ounce of gold when minted, or coined, will produce the equivalent, in sovereigns, of 85 'shillings' or 20.67 'dollars'. Otherwise the word 'price' as applied to gold is a misnomer, and causes endless confusion and misunderstanding when so employed.

So-called 'paper money' is not money. It consists simply of promises to pay money (that is, gold coin) and as long as such so-called money is 'convertible' it must be redeemed, eventually, in gold coin, or its equivalent. Therefore, if gold in the form of bars, nuggets, or 'dust' is paid for in Federal Reserve notes, or Federal Reserve bank-notes (for both kinds are issued), National bank-notes, greenbacks (United States notes), or any other form of 'convertible' *paper promises to pay gold*, the transactions mean that the sellers of the bars, nuggets, or 'dust' have accepted the promise of the Government or the banks to pay them an equal amount (weight) in gold coin. And as security for such promises the Government and banks together have, approximately, 55% of the necessary gold on hand. This brings up the element 'credit', which opens up such a vast field for argument it seems best to stop short; adding, only, that it might interest some of your subscribers to read the inscriptions on the different kinds of paper-promises-to-pay money. The transmutation of paper into gold is successfully accomplished with the aid of credit, for all practical purposes, sometimes. But when confidence disappears 'paper-gold' goes with it.

W. DEL. BENEDICT.

New York, November 21.

The Editor:

Sir—The letters by W. Karri-Davies and B. W. F., appearing in your issue of November 9, on the subject of 'The Gold Standard', are certainly of interest. It seems to me that the basic idea should appeal strongly to all mining engineers.

The calling in of "all the present existing gold (bar, coin, jewelry, or any other form) . . . and all enemy gold of every kind" by each nation of the future league of civilized nations (with the subsequent re-valuation of pure gold as 40 dollars, 8 pounds sterling, or 200 francs per ounce) would undoubtedly cause wild wails of protest to issue from some quarters.

Viewing the idea calmly and deliberately, it appears that the present civilized possessors of gold in whatsoever form have no just cause for worry. A hasty conclusion might be that Mary and Jane and Eloise will have to part with their treasured trinkets, even to grandma's wedding-ring. But it need not reach that stage. Should the various governments in question agree on a plan based upon the suggestions of Messrs. Karri-Davies and B. W. F., a simple modification suggests itself.

The possessors of gold in a form such that it has, for them, a value not measurable by mere money should be permitted to submit the article in question to a duly authorized representative of their government for appraisal. After such appraisal and upon payment to their government the difference represented by the enhanced value of the contained gold, the articles should be returned with a certificate bearing a description of the articles and a receipt for the payment made. A similar ruling should be made for manufacturing, wholesale and retail jewelers; as well as for temporary custodians of jewelry belonging to persons in temporary distress. The certificates should be transferable a stated number

of times, to facilitate the ordinary phases of commerce in such articles. In such rare cases where the possessor (or ci-devant possessor, temporarily alienated and presumably less rare than the foregoing) failed to possess, at the moment, the money necessary for the payment to his government, a lenient government such as ours might act the part of a benevolent 'uncle' for a stated time without charging the high rates per month so common to commercial 'uncles.'

A carefully-planned re-valuation of existing gold would cause no hardship whatever to the people. The civilized peoples of the earth would not lose one cent, penny, centime, or centavo. "How is that?" says the casual reader; "nobody gains; then what's the use"? Yes, somebody gains. The people, as individuals, lose nothing. The peoples, as bodies politic, gain the seigniorage. In the case of the people of the United States of America this represents, approximately:

Total ounces $\times$ ($40 – $20.67) – net mint expense.

The ratio for Great Britain and France, as outlined above, will no doubt allow those peoples a slightly larger margin of profit; but do they not deserve some consideration for bearing the brunt of the conflict about to end?

The item of Major Karri-Davies' letter that gives me great joy (almost as much as that which I derive from the contemplation of what a boost the mining and allied industries will get) is that where he says "of the world . . . the annual production about $450,000,000 of which the Allies produce 91.3%, the Neutrals 8.1%, and the Central Powers 0.6%." There is no room for argument. All we need is discussion in the right place.

Process for Recovering Platinum

The Editor:

Sir—In your issue of October 12 you print an article by V. J. Zachert in which he claims to have discovered a method for amalgamating platinum, and describes the method.

Mr. Zachert does not state how long he has been using this method, so it may be difficult to say whether or not his was the first 'discovery'. While carrying on an investigation of California's platinum resources in 1917 under the direction of the State Mineralogist and in cooperation with the U. S. Geological Survey, I met in Oroville an old gentleman named A. H. Sherwood, who has been successfully amalgamating platinum metals in dredge-concentrate for several years past, on a small working-scale. Sherwood makes use of an acidulated solution of copper sulphate to obtain a coating of metallic copper on the platinum particles, but his method and apparatus are much simpler than those described by Mr. Zachert. Mr. Sherwood's process is rapid, the recovery appears to be all that is desired, and the chemical reactions are positive under proper conditions. He demonstrated his process to me, and offered the use of it to the Government for war purposes without cost. I was so impressed with the possibilities of the method that I arranged for a second demonstration by Mr. Sherwood before a representative of the U. S. Geological Survey to whom Mr. Sherwood repeated his offer to permit Government use of his process. It will thus be seen that the Government, through its representative, has had full information on the subject for 13 months, and was in a position to use the process if it so desired.

A few months later, in conversation, I confidentially mentioned the Sherwood process to Prof. W. C. Blasdale of the Department of Chemistry, University of California. Professor Blasdale will corroborate me when I say that he was somewhat skeptical when I described the agencies used and the results obtained. Because of the comparative insolubility of the platinum group of metals it did not seem possible to create the electric cell required, with the means used. I thereupon demonstrated the process to Prof. Blasdale in his own laboratory. It took only a few minutes to show that, under special conditions, the copper plating of platinum particles and their immediate amalgamation with plain quicksilver was possible. Zinc amalgam is not required. The process works equally well on pure platinum, on osmiridium, or on any of the intermediate alloys.

Mr. Sherwood's application for patent had been before the Patent Office for some time before I met him. He has obtained patent for one stage of his process. When he first applied for patent, the Patent Office said that two processes instead of one, were involved. They gave him a patent for the final step, which consists of "separating amalgamated gold and platinum metals," but refused patent on the process of amalgamation because, as Mr. Sherwood said, they held his formula to be "untenable." At the time he applied for patent, he did not understand the chemical phenomena involved well enough to state correctly just what occurred, and said that I was the first one who had clearly explained it to him. I was never able to learn just how he came to evolve his process. Early in 1918 he planned to amend his application, but I am not advised whether he has yet obtained his patent. If a remember rightly, however, he stated that a patent was granted in Washington for amalgamating platinum by the help of copper sulphate about 80 years ago. Mr. Sherwood hoped to circumvent this fact by making his application cover "a process for amalgamating gold, platinum group metals, and other metals."

There are other factors, such as temperature, condition of the mercury, and classification of the sand treated, which seem to have an important bearing on the success of the method, and which have not been mentioned by Zachert. Mr. Sherwood believes that a solution of certain temperature gives best results. He also believes that classification should be used, and separate treatment resorted to for saving the finest gold and platinum, which are in the slimes.

James W. Neill points out in your issue of November 23 some of the obstacles in the way of using the process on a large working-scale. He has also mentioned a point

regarding which I take issue with Mr. Zachert. I have been advised by employees of the Natomas Consolidated of California that the Neill jig is very successful in saving 'black' or 'rusty' gold, but that most of the platinum recovered comes from re-concentrating the black sand from the dredge-tables on a Senn panning-motion batea.

San Francisco, December 3.

Copper Production of Mexico

The Editor:

Sir—In your issue of the 16th inst., under the caption, 'Copper Production of Mexico', quoting from the 'Boletin de Minero' for the period of May and June 1918, you give as the total production of copper from Mexico for 1917, 211,252,126 pounds; and of this amount the State of Nuevo Leon is credited with 183,365,000 lb., while the State of Sonora is down for only 68,396,865 lb. I have not had an opportunity to see the original figures in the 'Boletin de Minero', but I feel sure there must be some mistake in these figures, especially since your total does not check with the amount credited to the various States. I shall be interested to know what the correct figures for the copper production for the period was.

Royal P. Jarvis.

Cananea, Mexico, November 25.

[In our issue of June 22, 1918, page 848, we published a table giving the metal production of Mexico for 1917. This was also from the 'Boletin de Minero'. The total copper output was 141,528,966 kg., of which 31,089,484 kg. was credited to Nuevo Leon and 83,348,000 kg. to Sonora. In the original these totals were reversed, and thinking as our correspondent does, that there must be a mistake, we gave Sonora the larger output. In our issue of November 16 we failed to do this again, hence Nuevo Leon showing the larger yield.—Editor.]

The Utah Copper Enterprise

The Editor:

Sir—In reading your article on the history of the 'Utah Copper Enterprise', I do not see reference to an option on the property held at one time by L. C. Trent. Perhaps the following may be of interest:

In either the latter part of 1902 or the fore part of 1903, I met L. C. Trent in New York. He said: "Wiseman, you are just the man I wish to see. Tell me something about the concentration of low-grade ores at Clifton, Arizona." I spoke to him at considerable length concerning the character of the ore and the method of treatment. He then remarked: "Wiseman, I think I have the biggest copper mine in the world." "Where is it?" "It is in Utah. There are two railroads crossing the property, there are mountains of ore, and while the crude ore only averages about 2% copper, I can make concentrates from it that will go 30% and over in copper." I asked him what he was going to do with it, and he answered: "I am back here for the purpose of getting some parties interested in it."

One year later, I met him in San Francisco and I remarked: "What about that whale of a copper mine that you were telling me about?" He replied: "Wiseman, you know that I know all the big mining interests in this country. I went to them all and explained the proposition and they simply laughed at me. They said it was ridiculous for me to come back there and try to make them believe that I could get 30% concentrate out of a 2% ore and that a 2% ore under the conditions I named would not make a commercial proposition. I offered to a Boston crowd to pay all the expenses of their engineer if they would have him make examination and he reported that the property was not in every respect as I represented it. And they even turned that proposition down." I then asked him what the property was and he said that it had been taken hold of by others and was now known as the Utah Copper Company.

At the time I met Mr. Trent in New York, I had recently resigned as the general manager of the Shannon Copper Co. after I had spent about two years at Clifton, of which fact he had knowledge.

I note also that you refer to the underwriting of $3,000,000 worth of bonds for the Utah Copper Co. by the Guggenheims. My understanding of the way in which the Guggenheims became interested is as follows: Seeley W. Mudd, now Colonel, was acting at about that time as south-western representative of the Guggenheim Exploration Co. He was called upon to make an examination of the Ohio Copper Co. and he asked me to assist him in that examination on account of the knowledge I had gained of that type of ore while at Clifton. The sampling of the Ohio Copper gave an average so greatly below the average of the Utah Copper that the option on the property was not exercised. While making the examination of the Ohio Copper, Mr. Jackling gave Mr. Mudd the privilege of going through the Utah Copper and I accompanied him on the trip. At that time, or very shortly afterward, Mr. Mudd learned of the additional financing contemplated by the Utah Copper Co. and he took the matter up with the Guggenheims and this led to the examination of the Utah Copper at a somewhat later date by Mr. Mudd and the eventful underwriting of the bond-issue.

Los Angeles, December 4.

Molybdenum-Steel

The Editor:

Sir—In looking over your issue of October 19, I note an article by L. F. S. Holland. In the last paragraph of this article, Mr. Holland states that the Metals Reduction Co. is making ferro-molybdenum at Washington, Pennsylvania.

Mr. Holland, by some means or other, has got hold of the wrong name. Our company, the Electric Reduction Co., numbers among its officials such men as have been intimately associated with the high-grade steel

business for a dozen years or more and these men have been interested for some years in the possibilities of molybdenum, as an alloy with steel. Early last winter we began to pioneer among the steel-men with an idea of introducing various molybdenum-steels which we now offer. Soon after that time the Government became interested in our steels and largely through these two separate lines of endeavor, we became engaged in the manufacture of molybdenum.

We are at present producing approximately 60% of the molybdenum produced in the country and as soon as the War is over, we will resume our efforts to introduce molybdenum-steels for many uses which are, of course, of little interest in this crisis. We feel that you would like to have this information and that perhaps you would be kind enough to publish in your issue a correction, which would set this matter straight.

CLIFTON TAYLOR.

Washington, Pennsylvania, October 28.

Water Laws of Nevada

The Editor:

Sir—The periodical entrance of new legislators, presumably for the adjustment of the State laws under which we work and by which we are worked, while so frequently giving a presentation of that nature which suggests the applicability of Hamlet's remark to the effect that "'Twer a custom more honored in the breach than the observance", still, with each succeeding exhibition lends reason to the hope that legal defects may be corrected, and obscure law passages made clear.

It is rumored that the water laws of Nevada are to be readjusted during the coming legislative session, and every man who is operating a mine or mill upon a water-supply obtained from his vein or dike, or from any subterranean channel or watercourse should interest himself in the proposed legislation. It is probable that the larger consideration will be given to waters available for irrigation, but as Nevada is first a mining State and possessed of but little water, the safeguarding of the water-rights of those who invest their money and years in mines and mills should be of grave import to our legislature. The danger to the class of operators mentioned can be best illustrated by references to a case in point.

Eldorado canyon, in the south-east corner of Nevada, is the result of erosion along the lines of weakness that accompany a strong porphyry dike that was thrust up through an older andesite intrusion in a monzonite country-rock. The cooling and shrinkage movements were chiefly along the foot-wall of the more recent porphyry dike, causing, along that contact, a brecciated and open condition that became a subterranean watercourse, which yields water in an otherwise arid region, wherever it is opened throughout its length of ten miles from the summit of the range, easterly along Eldorado canyon to the Colorado river. This dike now carries the only water of consequence in that region, and, in former ages, it was the channel along which passed mineralized solutions, as evidenced by the deposition therein of gold, silver, copper, lead, and zinc.

In this dike a shaft was sunk, cross-cuts were made, and considerable driving was done along the foot-wall. The shaft drew water from the foot-wall of the dike. The cross-cuts into both walls have always been perfectly dry. The dike foot-wall exposed by the drifts on three levels is always wet with incoming water having a course eastward, down the canyon toward the Colorado river. A strong cross-dike, readily traced for two miles, cuts and faults the dike in question near the shaft mentioned, but the crossing dike is perfectly dry, showing the absence of any general water distribution in the region.

This mine development was the first exploitation of any extent in the dike, and it resulted in the opening of a most promising mine. As several years baling from the mine-shaft had proved a daily yield of from 9000 to 20,000 gallons of water, varying with the season, and as no other parties were using either the surface or subterranean waters of Eldorado canyon, or had made any water-filings in the entire district, the company that had opened up this ore and water filed upon the water flowing along that subterranean channel and also upon a certain portion of the surface water that flowed upon the canyon-floor for a time after the rainy season. These filings were approved and granted under the Nevada laws, a 75-ton cyanide-mill was built upon the property, and mining and milling operations were commenced.

At about this time lessees had erected a mill upon a mine in a gulch parallel to Eldorado canyon, found their mine and gulch carried no water, bought some non-mineral claims a mile up the canyon from the first mentioned developments and covering the water-carrying dike, sank therein for water, with success, and pumped the dike-water over the mountain to their mill, thereby diverting the water of Eldorado canyon from its natural channel, with the result that the dike ceased to supply water to the mine-workings of the parties who had developed the water and to whom it had been granted by the State, and consequently their mining and milling operations had to be stopped, and so now remain. The cause was tried in the Tenth Judicial District and the interpretation of the Nevada laws permitted the continued diversion of the water of Eldorado canyon from its natural channel and from the service of those who developed it and had held it in undisputed possession and beneficial use for several years.

The trial of this case developed obscurities in the Nevada water-laws resulting in conflicting opinions among the attorneys touching various points. For instance, while the laws of Nevada proclaim that waters flowing in channels whose boundaries and direction of flow are possible of determination belong to the State, and are therefore subject to appropriation under the State laws; and that percolating waters are not subject to such appropriation; there is a wide difference of opinion among the lawyers and judges as to the classification of percolating waters. The definitions of per-

colating water in the books of authority on both California and Nevada water-law are inexact and insufficient; probably because it has not seemed necessary to place upon record a close definition.

As courts and judges can, by visitation, and tests, satisfy themselves as to the physical nature of any ground formation in question, it seems to me that an exact and complete definition of percolating water should be established and made of authority, and as a starter, the following is suggested:

Percolating water is ground-water existing in that porous character of earth or rock that permits the water to yield to the influence of capillarity and gravity, which influences cause a general diffusion of the water through its containing medium, thus creating in the containing earth or rock a semi-saturated or saturated condition of indeterminable boundaries and direction of movement.

This definition might be accompanied by a note to the effect that, in such an area the contained water adjusts itself closely to a general level known as the water-table, and shafts sunk anywhere in such an area to a depth below the water-table must, because of gravity and capillarity, accumulate water, which will rise to the level of the water-table of the region. Such shafts may become accepted demonstrations of the nature of the ground-water of any region, and a box of sand partly filled with water, or a partly submerged block of sandstone may be conveniently used for illustration.

The hard crystalline rocks of the Eldorado mining district are impervious to water, as evidenced by the dry shafts, drifts, and tunnels along the Eldorado dike-course, unless they cut the water-channel described above, and as further proved by the necessity of the coming of the successful party to this suit to the Eldorado canyon vein for water, while his own vein is parallel thereto, his shaft the deepest in the district and but 200 ft. north of the mine development described in Eldorado canyon, a low mountain intervening.

Notwithstanding the clear and abundant evidence as to these ground conditions, some of the attorneys in the case were of the opinion that the waters in question should, under the Nevada law and practice, be designated as percolating waters. The Court, while uncertain upon the point, did not decide the case upon that assumption. In this case Nevada legal practice and decision have established the following condition in Eldorado canyon:

The shaft of the suffering parties is six miles up the canyon from the Colorado river. The well of those who are diverting the water is one mile farther up the canyon; leaving the upper three miles of Eldorado canyon and its water-conducting dike open, under the Court decision, for repeated exploitation for water, each successive well shutting off the water from its neighboring well below it in the canyon.

The absurdity, inequity, and danger to mining investments in this condition should not be permitted to obtain and extend in Nevada. May not the mine-owners of Nevada lend aid to the legislators in the coming adjustment of the water laws of the State; and have any of the brethren suggestions as to the clarifying of legal dicta applicable to the case quoted?

G. A. Duncan.

Nelson, Nevada, December 5.

Spitzbergen

The Editor:

Sir—Your issue of November 2 contains an article respecting Spitzbergen and its coalfields. 'The Economist' of October 5 contains an article which differs somewhat from yours. It states that the international conference at Christiania in 1914 "was broken off by the War. No report of its proceedings seems to have been published, but the treaty of Brest-Litovsk pledged the German and Bolshevik governments to ask the Norwegian government to resume the conference, and endeavor to internationalize the islands on equal terms for Germany and Russia. The British government has hitherto declined to take action in regard to the islands during the War, but it was hinted by Lord Robert Cecil in Parliament in November 1916 that German claims pegged out during the War might not be recognized afterward."

You state that "W. S. Bruce, when reading a paper before the British Association for the Advancement of Science, in 1913, urged his Government to annex the island, but the suggestion was ignored, properly." The concluding words of the foregoing indicate that you are not aware that, early in the seventeenth century, Spitzbergen was a British possession, but was abandoned when the whales deserted its coasts. Whether Great Britain has, or has not, a reversionary right to Spitzbergen, it can at least be conceded that her claims are superior to those of any other power.

James White.

Ottawa, November 14.

The Alaska Treadwell, Alaska Mexican, and Alaska United companies, on Douglas island, own and operate three hydro-electric plants, one at Nugget creek, one at Sheep creek, and the '240' plant which utilizes the water-power from the Treadwell, Mexican, and United ditch-lines. These three power-plants have been all 'tied-in' with the Alaska Juneau steam-electric plant on the mainland across Gastineau channel for operating reliability, efficiency, and economy. This has enabled the Douglas island companies to sell and to offer for sale all their steam-electric generating machinery and boilers. The power output of the four tied-in plants is charged out according to the kilowatt-hours consumed (the Alaska Juneau being the largest consumer) on the basis of all operating costs plus a 10% interest and depreciation charge on the capital invested in the plants and equipment. The net earnings of the Douglas island companies under this arrangement have been $62,687 for 1917, and $15,494 for half of 1918. The decrease in 1918 is because of the dwindling power requirements of the Alaska Juneau due to the shortage of labor.

A Letter From the Front

THE BATTLE OF THE ST. MIHIEL OFFENSIVE

These past months seem like so many lifetimes, because they have been crowded with so many wonderful experiences, but the most wonderful of all is the one I am going to try and tell you about now.

Of course, you have read about our recent little show staged in what was the St. Mihiel salient. The papers, I am sure, have told that story and probably have given it many unnecessary high lights and used many lurid phrases of self-accredited glory when describing this little affair. So if you don't mind, I will confine myself to my personal experiences.

The official designation of that section of the General Staff known as 'operations', to which I am attached here at G. H. Q., naturally implies the planning of what commonly are referred to as 'battles'. But there is quite a distinction between a 'battle' and a military 'operation'; the latter is far more comprehensive in its scope.

Soon after undertaking my present job I, in the natural course of events, had to be informed of the proposed St. Mihiel operation, because I was required to work on the amazingly elaborate plans necessary to the success of such an undertaking. Little did I think, when I was struggling along with those damnable map-problems at the Staff College last winter, that I would so soon be called upon to apply the theory and practice to a situation in which I would be dealing with real men by the thousands, real conditions, and be assuming the responsibilities of sacrificing many human lives perhaps when making a miscalculation or a mistake in judgment. In the map-problems, when I balled things up, I only made a fool of myself and got a rotten mark on my work. But in this case, rotten marks would be symbolized by hundreds of graves filled with American soldiers. So perhaps you can appreciate to a degree what a terrible strain it is upon one's mentality and conscience to be placed in such a position.

Don't think for a moment that the part of the work entrusted to me was of great importance, yet in planning such a thing, every little detail has its direct bearing on the thing as a whole, no matter how insignificant that detail may be; and no matter how low in the scale of importance my particular job happened to be, it was sufficient to give me more than one brain-storm of the most acute worry I have ever known. Gosh! I lived and dreamed and talked the thing until my brain seemed to refuse to function on any other subject. I studied every conceivable type of map of the country so constantly that I felt I could recognize any square foot of it in the dark as an old and familiar friend.

Doubtless I am boring you with this long and involved effort to tell you about how we all worked so constantly on this thing and at the same time maintaining the greatest secrecy, yet it *was* a terrific strain, though wonderfully exciting and thrilling, for it was to be the maiden effort of the American Army, which was still so young and crude, and naturally the few of us who knew what was projected wanted it to be successful, if human effort could make it so. Well, it *was* a success of more than minor importance. Of course not to be compared with some of the really big things done by the British and French, yet considering its tactical advantages and its influence (both directly and indirectly) on the situation as a whole, it is nothing to be ashamed of, considering that the same thing had been tried twice before by others and had been a failure in each instance.

After this prelude maybe you can picture my state of mind when I left here two days before the show began to go up and watch the performance. Being unrestricted in my movements and for the time being vested with authority to issue orders in the name of the General, if I considered it necessary, I left here in my car one afternoon in a frame of mind that ranged between exultation and sickening dread. The red, white, and blue silk brassard with its 5-pointed star embroidered in gold, the insignia of a General Staff Officer from G. H. Q. that I was wearing, represented far greater authority than I ever expected my humble self to possess. I shall always treasure that bit of silk for its association with the most wonderful moments of my life.

Feeling that I knew where the most interesting things would happen, I went first to the headquarters of the Army Corps covering that part of the front. After getting the information I wanted there, I decided that a certain division would be the unit that would develop the situation in which I was most interested, so I went to the P. C. [Post Command] of that division. Subsequent events proved my guess to have been a good one.

The weather for a week before the show started had been unusually rotten. Torrents of rain had made all of the roads quagmires. This had its disadvantages, but really played into our hands, for it helped us to make our concentrations with most successful secrecy and made the surprise party almost complete to the Boche. After arriving at the Division P. C., I decided that to see the real thing, I would have to go up to the actual front and see the thing off. As you perhaps know, the attack was preceded by a four-hour bombardment, and when that began, I went up to one of the attacking battalions and attached myself to a company, for by this time I had decided that the only way to test the efficacy of the long worked-over plan and to form a basis of possible future plans, was to watch the thing function from the actual

front line and work from there back to the higher command, rather than reverse that order. Also, I had a pretty well defined idea that when that line once got started, it would be devilish hard to catch up with again.

It was raining with almost tropical violence, and though I had discarded everything but my map-case, prismatic compass, and gun, it was no easy matter to make my way up to the jumping-off line. Gee, it was spooky! Part of the time I was knee-deep in mud, while on the road, and then having to make straight across country following the compass-bearing. That little trip of about three kilometres taught me some valuable lessons.

I left the Division P. C. at 1 a.m. and knowing that zero hour was to be at five, of course four hours seemed absurdly ample to cover the distance of less than two miles. As a matter of fact, it took me nearly three hours, and you will laugh at my stupidity when I tell you why. In order to protect my compass, a delicate and expensive instrument, from the rain, I held it close to my face while reading it in the dark; but in addition to protecting it from the rain, my steel helmet also caused a deflection of about fifteen degrees, which was something that I did not reason out for about an hour, by which time I was a considerable distance from where I was headed. I am glad to say that I did have sense enough to comprehend the trouble at last, and from then on, when I made a reading, I removed the 'tin' hat and protected the compass with my hand. Is it any wonder that I am in a constant state of fear that some day they will discover what a bone-head I am?

Having left my rain-coat behind, of course I was drenched, yet I was not cold, because I had too many other things to think of.

At last I found the exact place for which I was looking by stepping on the legs of one of the men lying just outside the jumping-off trench. My arrival was duly heralded by a mild outburst of profanity from both the man on the ground and myself, actuated on his part doubtless because of the hob-nails in my shoes, which hurt like the devil when pressed into his legs, and on mine because I was startled almost into a spasm when I realized that I was standing on a human being.

Having about an hour to wait before zero, I found the platoon commander, who happened to be a boy from Virginia who couldn't get nearer than 'tar' to the accepted pronunciation of 'tire', as I learned in subsequent conversation, and laid down beside him. I have been a bit uncomfortable in my life, but those sixty minutes lying in the mud and drenching rain come pretty close to being the most damnably uncomfortable period of my 39 years existence. Yet I would not take a million dollars a minute for it now.

We were just over the crest of a small hill and had a perfect view of the country in front of us for quite a distance.

I am not going to be such an idiot as even to attempt to describe to you the effect of the perfect hell of shell-fire that our guns of all calibres were raining all over that trench system. It seemed as if the whole world as far as the eye could see, was a huge inverted collander with spurts of liquid flame shooting through each of the thousands of holes, the size of which being determined by the size of the bursting shell. It really was a mystifying illusion and it was practically impossible for me to realize that the whole world was not afire under its crust, and that the flames, being urged upward by some demon in hell, were frantic in their fear and haste to escape from their diabolical tormentor. It seemed impossible for me to comprehend the thing and believe in its reality.

During such moments of mental stress, one's mind plays many pranks. I would suddenly find myself oblivious of the marvelous spectacle out there in front and awaken to the realization that the youngster shavetail lying beside me was discoursing on the merits of the Stutz car we drove at home, which explains how I knew he couldn't say 'tire'. Well! we simply waited for zero, consulting our watches occasionally, so as to know when to prepare to start. I knew what was going to happen at zero hour and really would not have needed a watch to know when it arrived, but I actually counted the seconds of the last minute as a matter of curiosity, to see how near schedule our barrage would be put down. Just as I counted the 59th second the peculiar half-bark and half-crackle of the 75s, which you soon learn to distinguish, began with a ripple; then ran across the front and almost instantly merged into a continuous roar, and out in front about a hundred metres away, you could see a lurid line that paralleled the departure trenches almost as perfectly as if it had been laid out with a T-square. Everybody was glad to get up and stretch a moment and then start forward at a deliberate pace. It was known that the barrage would advance at the rate of 100 metres per four minutes, so the only thing you had to do was to keep your place in the line and keep on going. You instinctively feel when you are the proper distance from the barrage, and as you expect an occasional 'short' it does not seem to disconcert anyone when it arrives. If you are too close to it to avoid stopping a fragment, well, that is the rub of the green and you are just out of luck.

The Boche had spent four years of constant work in organizing their position and when a few hours later, under more placid conditions, I had a chance to examine the maze of wire and intricate trench system that looked like some huge and complicated *motif* of lace worked in the ground, I marvelled at the possibility of anybody getting across it, yet that bunch did cross it in perfect order and with a nonchalance such as you would have considered possible only when strolling along a perfectly graded cement sidewalk. Somehow you didn't know that any wire was there and of course it was comparatively easy to jump the trenches. Please believe me when I assure you that so far as I was concerned, I was hardly aware of the wire or other obstacles in my path at the time and not until I began to trip over what had been a pair of shoes and wrapped puttees, which upon

investigation I discovered were reduced to ribbons, did I have any real consciousness of having crossed that wire. If you had seen me when I returned to the P. C., you would have laughed, for nothing worth while was left below my knees, either of my breeches, puttees, or shoes, so I resorted to the brilliant idea of using some first-aid bandages in place of what *had* been a perfectly good pair of Fox Frayless.

Well! that is about all there was to it. They simply kept on going, and at no time did they vary more than 12 seconds in reaching any of their objectives. The Boche didn't have much fight left in him after that bombardment, and did surprisingly small execution with either his machine-guns or his artillery. Only two men were killed in the platoon I was with and not many others were wounded. I continued to advance with the line until about 7 a.m. and then decided to return to the Brigade P. C. to report the exact position and progress of the attacking line. All telephone wires had by that time been cut by shell-fire. Naturally I thought that progress to the rear would be easier than going in the other direction, but as a matter of fact, the real excitement of the morning was still due me.

A well organized mopping-up line was following the attack to clean up all out-of-the-way places that the front-line troops could not waste time to bother with. These moppers-up were doing their job quite thoroughly and were not as close up to the front line as I thought, as was made evident by the number of Boches still to be seen darting about in the rear of the front line; but still I thought nothing of that until I discovered that these stray Boches were not as friendly as they should be under the circumstances. Well, that is where my real fun began. In going through a small wood with rather thick underbrush, I kept my eye peeled for trouble and my automatic in my hand, though I really did not expect to use it, wherein I was mistaken. About fifty feet ahead of me I observed a Boche duck behind a tree in a rather threatening manner, so I approached cautiously, thinking he would surrender, but as I stepped into a small cleared space, the fool let go with a hand-grenade and ducked behind the tree again. Knowing that at least six seconds must elapse before the thing exploded I naturally ran away from it, but in the direction of the tree behind which he had ducked. I arrived at the tree just as the grenade exploded and as he put his head around to see what had happened, his nose almost touched the muzzle of my gun, and it makes me chuckle to think how surprised he must have been if he had time to think during the fraction of a second that elapsed before I pulled the trigger. I don't know what he looked like, because I couldn't get a good look at him during our little dodging match, and afterward—well, his face, or what was left of it, was not very pleasant to look at, so I made only a cursory examination. I am not the least bit ashamed to say that I was so darned tickled that I grinned all over and felt very much as I did the time I shot my first buck up in the Adirondacks, an occurrence that was immediately recalled to my mind.

Feeling pretty good, I went merrily on my way, thinking that my part of the show was over for the day, but again I was mistaken, for almost immediately another one started to rush me with a vicious-looking trench knife. He was just a bone-headed damn-fool, for I had him covered all the time and ordered him to halt twice. It is true there was considerable noise and I did not strain my voice, yet he could not have mistaken my intention, which was to make him my own little prisoner. However, he kept on coming, so I let him have it. Hutch would say I was a damn poor shot, for I aimed at his stomach, but really hit him above the heart and at ten feet that is not very good shooting, but it did the trick. He fell over backward like he had been hit by an axe, for that Colt has a terrible wallop with the extra heavy ammunition we use over here and I was really amazed at the result. But here is really the interesting part. When I looked this bird over, imagine my surprise to discover the figure 7* on his shoulder-loop. Gosh! I almost yelled with delight, and, although against intelligence regulations, I could not resist the temptation to rip off one of the loops on which the magic figure was embroidered in red, and I think I shall send it to the new Company I as a souvenir of the occasion. So at last I have two notches in my gun. Altogether that makes three of those pups I am *sure* I have to my credit, one each for you and one for myself. The fourth I feel pretty sure of, but I didn't actually see him because he seemed to fall in the trench. The first two you will recall I mentioned in a letter either to you or Hutch, as having gotten from a sniping-post last winter when I was with the Guards. Should they by any chance bump me off now, I will at least have the satisfaction of knowing that the ratio is three to one in my favor.

I simply can't find time to repeat all this junk in a letter to Hutch, and knowing how his blood-thirsty soul will envy me my opportunity, won't you please tell him about it, and be sure to tell him that though I frankly acknowledge his superiority over me in the shooting line, I'll be damned if he could do better than get a hundred per cent of hits. Yes, it gets into your blood in time. Last winter I felt the need of a drink when I saw that chap I potted, but this time I felt more like buying a drink for the whole A. E. F. I was so darned well pleased with the luck I had.

Finally I got back to where I had left my kit, got into another pair of breeches, shoes, and puttees and was as happy as a kid on Xmas morning. By noon we had collected about a thousand prisoners at the P. C. and I had a most interesting time in looking them over and talking with the surprisingly large number who spoke English and quite a few others who flattered me by pretending to understand my attempts at French. Really you can't imagine how interesting that was. Also, don't believe all the bunk the papers print about the dilapidated condition and unnourished state of the Boche soldier. He is clothed and shod as well as our men are and particu-

*The writer belonged to the famous Seventh Regiment of the New York National Guard.—Editor.

larly neat and clean in appearance. His food is restricted in variety, of course, but he shows absolutely no indication of not having all he needs to eat. Neither has he many misapprehensions regarding what we have done and are capable of doing in this war. He underestimates our numbers now in France by not very much and he certainly did *not* expect to be mistreated when captured. In fact, all of them were obviously tickled silly to be prisoners and at times when a new batch would arrive at the pen it was just like old home-week, the way they would greet each other, shake hands, and laugh at what they seemed to consider their good fortune.

I must admit that I had the surprise of my life that morning in many things. Our line kept on going and soon the question of traffic became of vital importance. Really, my dears, it beggars description. I simply can't convey to you any idea of the condition of those roads used to supply that rapidly advancing line. Naturally, there were no roads across No Man's Land and the elaborate trench systems on both sides of it, so they had to be built and damned *tout de suite* at that. Building roads under shell-fire is not the pleasantest occupation known to man, but they were built nevertheless, and were soon jammed with more different kinds of vehicles that roll, crawl, and creep than you have ever seen. In my nine months over here I had not seen a lot of those darned queer-looking things before, though I knew most of them by name. It is not difficult for an army to advance, but the biggest job is to supply it and in every bog show the words 'transport' and 'traffic' soon become the things that cause more human anguish, worry, and anxiety than I ever before knew could be packed into two such simple terms. But I could write volumes about that and not begin to scratch the surface of the problem.

Thank God, I managed to realize to a degree the real importance of that prosaic subject that used to bore me nearly to death at the Staff College last winter. Really the whole game of modern warfare is based upon supply, and the things you can feed into the insatiable maw of an army on the move without beginning to satisfy its needs, makes one's brain reel when trying to comprehend it. Producing an army of 5,000,000 men is a cinch compared to keeping it supplied after you once have it, and we had only a small fraction of that number of men engaged in the St. Mihiel show, yet our problems nearly turned my hair white. Incidentally, I am the beneficiary of the greatest piece of luck you ever heard of in connection with that traffic situation. I had to go past a cross-roads that was having the far shelled out of it with both H. E. stuff and gas, a nasty combination. Just before I arrived the Major in charge of traffic there was killed by a shell and things were rapidly getting into a damnably confused state. That particular cross-roads was of vital importance to our supply system and I naturally couldn't stand around and see my first little pet battle spoiled in that way, so I took over the job for 18 hours, and for the first time in my life I got some real advantage from an ability to cuss mildly. You know you really can't be a successful traffic cop without a little profanity at your disposal. Of course, having to wear a gas-mask is a bit of a handicap, for it requires you to eat your own words, as it were, and also gives the enraged drivers of all sorts of vehicles a chance to cuss back at you without being court-martialed, but the blue tinge your cussing gives to the atmosphere seems to neutralize the effect of gas. Anyway we managed to keep things moving fairly well past that damned place and the day after my return here I was informed, greatly to my surprise, that I had been made a Lieutenant Colonel. Funny old world. For over a year a lot of people have seriously tried to make me a Major and finally as a great concession their efforts were successful and in less than a month thereafter, just because I spent a few hours having the time of my life thinking up new phrases of profanity while serving my novitiate as a traffic cop, they, with the stroke of a pen, turned my gold leaves to silver. If that poor chap at that cross-roads, whom I knew quite well, and he was a corking officer, had not had the hard luck of being killed, I suppose I would have remained a Major the rest of my military career. Rotten game this and I am beginning to hate it like hell at times, when I think of that phase of it, yet it gets into your blood somehow and in other ways is the most alluring and fascinating occupation one can possibly engage in. I am reeking with rank now and Heaven knows I am not seeking more, I just want to get back with that old bunch for one rip-snorting scrap, for I know what they can do and I want to be with them when they do it. If they will only let me do that, I would promise never to peep again, no matter what job they put me on. But what more can I do? And all the time it worries me nearly sick for fear that some of that crowd may think that I am really not making any effort to get back and that I am quite content to enjoy the privileges and what they probably think are the comforts of my present job. Oh! if they could only know how I feel.

I had to stop here rather abruptly and start for Verdun in connection with another marvelous show that began on the morning of September 26. I have just returned to get some more things to wear and am off again this afternoon to another part of the front. Of course, you are reading all about what is going on over here at present. I could write you volumes about some of the things I have seen during the past ten days, but things are moving too fast to make it possible for me to find the time. I wanted to tell you about the amazing accomplishment of the 3rd battalion of the old Regiment. It's tragic, but wait until you hear from me about it before becoming unduly alarmed. Be careful not to mention this to anyone so as to avoid wild rumors. Just remember that Company I and the other three companies of the battalion will occupy one of the most brilliant pages in the history of this wonderful war. That is not romance, but cold-blooded fact, so much so that I fear you will be shocked and sad if what I believe to be true is verified, yet it is glorious. I don't know when I will be back, so am scribbling these few lines of attempted explanation and will start along. My God! but it is great to be alive, in France and in this war.

Sampling

By F. W. BUNYAN

Introduction. The technical chemist knows from experience how disheartening it is to go through the analysis of material handed to him that he is aware has not been properly sampled and that will therefore, despite the most careful analytical work, only serve to misrepresent the facts. Sampling is the alpha and omega of chemical control and is, if possible, more relatively important than the subsequent analysis. Of what avail is the most excellent superstructure when the foundation is unsatisfactory?

So much has been written on the subject that it is perhaps about threadbare, but it is one of those fundamentals that cannot be too thoroughly emphasized. The chemist is employed as a mechanic of control, and in order to justly and satisfactorily pin the responsibility upon him he ought either to supervise and control the actual sampling or, in those cases where such is genuinely not feasible, have the assurance that it is carried out to his personal satisfaction. To attempt to make a man responsible under any other conditions is alike foolish and unjust, and, in extreme cases, it may be almost criminal in its results. Where, however, proper sampling conditions exist the responsibility can be definitely fixed, to the mutual satisfaction and peace of mind of all concerned. Sometimes jealousy or, it may be, tender corns stand in the way, but either efficiency on a basis of justice is aimed at, or it is not.

H. C. Hoover* treats the subject briefly from the mine-valuer's standpoint. Bauer touches an altogether different phase and gives one or two interesting instances. To those handling iron and steel the whole first half of this book will well repay study.

In a well organized enterprise, such as a large mine, smelter, or steel plant, the value of systematic sampling is generally appreciated, but speaking of the industries as a whole the common indifference to the importance of sampling, and to meticulous exactness in performing it, is nothing less than amazing.

The best book so far encountered dealing in any detail with the subject of mineral sampling is Rickard's 'Sampling and Estimation of Ore in a Mine.' This work is particularly valuable as including the written discussion of various phases and the different experiences of no less than 25 well-known men. Even to the man who is not brought into everyday contact with the mine there is much that is suggestive and that will well repay careful study.

I have wondered if we shall, in the more intensive development of the future, see a chair established in some one of the universities to deal with the question of sampling; certainly its financial importance would well justify it, whereas at present it hardly figures in the curriculum. How many mines, particularly gold mines, have been over-capitalized and later shut-down as an almost total loss, apart from any question of knavery, on account of no other thing than inefficient sampling.

An Example. To turn to a specific case, namely, the sampling of a magnesite ore, and touching first, briefly, the theory of the matter: the specific gravities of the chief constituents are:

Mineral and formula	Specific gravity
Magnesite, $MgCO_3$	3.0
Silica, SiO_2	2.3 to 2.6
Serpentine, $Mg_3H_4Si_2O_9$	2.5 to 2.6
Calcite, $CaCO_3$	2.7
Dolomite, $Mg:Ca(CO_3)_2$	2.8

The last four constitute the principal foreign ingredients or impurities. The contract for purchase usually specifies the maximum of silica and lime, and the market-value of the ore commonly varies according to the extent that these two are relatively absent. Silica and lime, then, are the factors of prime interest. The pulp as prepared for analysis all passed a 100-mesh screen.

On this basis, assuming for argument the mean diameter of the particles to be 1/200 inch = 1/200 × 1000/40 mm. approximately = $\frac{1}{8}$ mm. diam. = 1/512 mm.^{3}, or, say, 1/500 mm.^{3}

If the sp. gr. be 3, then 166,666 such particles weigh one gramme, and taking 2.6 as the mean sp. gr. of the impurities, then likewise 192,309 such particles weigh one gramme.

Taking now, for illustration, an ore containing a total of 8% of all impurities, 1 gramme contains (92/100) × 166,666 particles $MgCO_3$ = 153,332, and (8/100) × 192,309 particles impurities = 15,384.

Then by Poisson's formula the limit of sampling-error is $\sqrt{\frac{8 \times 15,384 \times 153,332}{168,716}} \cdot 334$ = a variation of 2.17% on 15,384.

Applying this to the impurities, 2.17% of 8% = 0.17%, that is, the limit of sampling-error is 8 ± 0.17%, that is, between 7.83 and 8.17%.

Taking another illustration, an ore containing a total of 4% of all impurities and calculating by Poisson's formula, the limit of sampling-error comes out as 3.15% of 4% = 0.126%, that is, the limit of sampling-error is 4 ± 0.126% = between 3.87 and 4.13%.

In either case these limits are maxima; the mean variation will be approximately one fourth of the limit; in the cases quoted it would range between 7.96 and 8.04%, and from 3.97 to 4.03%.

The conclusion is that, so far as the pulp (100-mesh) is concerned, the error is within workable limits so long

*'Principles of Mining': (1909) pp. 4-11. 'Sampling and Analysis of Iron and Steel': Bauer and Deiss (1915), English translation by Hale and Williams.

as every precaution is taken by the sampler in handling his machines and in keeping them clean, in dividing and quartering, and in mixing. The importance of scrupulous and rigid care in mixing in order to obtain the most nearly homogeneous mixture that the degree of fineness of the pulp will permit cannot be too strongly emphasized.

There is one more point that has to be watched in the laboratory, particularly in the case of samples that have been lying by or that have come by post, and that is the tendency to segregate. Every chemist is aware, for example, in the case of samples of pig-iron, of the tendency, if the drillings have lain by for a day or two or have been shaken, for the graphite to separate out and come to the surface, and of the totally misleading analyses that can in this way be obtained if not guarded against by careful mixing. Similarly many minerals have this tendency, in a less degree but sufficiently to affect analyses, as, for instance, where there is any marked difference in hardness as between magnesite and silica, or where one of the ingredients is present in the form of small round polished crystals, such as spinel, ilmenite, or magnetite, which are generally present in the Californian magnesite and have this tendency to separate.

Crude Material. To pass now to bulk-sampling, or the selection of the actual sample, in the magnesite example, unusual difficulties were experienced for a variety of reasons. The magnesite was bought from various local mining companies, calcined in rotary kilns, and the bulk shipped to the East for refractory purposes under a strict specification. Three of the supply companies we will call X, Y, and Z, taking the X people first, as on the experience gained with them the subsequent modus operandi was based.

I was analyst and works chemist to the purchasers, and the X company commenced their deliveries on the same day when I entered on my duties. They seem previously to have been getting out a really good grade of ore, but unfortunately at this particular moment they struck a silicious lens in the midst of their main orebody. Some loads shipped to our plant looked high-grade to the eye but on breaking them with a sledge-hammer they showed a crystalline quartz nucleus that, while interesting enough from the mineralogical point of view, rendered the stuff practically unmarketable. One casual grab-sample showed as high as 24% silica, whereas 4% was the topmost limit, such material being purchased only under protest.

Grab-sampling had been customary up to this time. That is to say, the sampler went over the dump representing the day's delivery and selected therefrom something like 30 pounds of what he considered to represent the pile. The sampler was a conscientious employee, but he took an interest, too much interest, in his work. Knowing that silica was commencing to give trouble, and being instructed to keep his weather eye on the matter, it is not surprising that, making his grab, he regarded the more silicious portions with a liberal but by no means friendly eye, grabbed such, and the results on analysis may be imagined.

Dispute followed dispute: counter-samples and umpire-samples were taken; they were taken interestedly, if unintentionally, with the result that some most diverting variations came to light and some rather heated arguments ensued. Analyses were checked and re-checked, umpire-analyses made, and the whole matter generally turned inside out, but the analyses stood. On the mode of sampling employed, the X company could not get behind our findings.

Analysis of the following three deliveries, as usual, was based on grab-sampling, and was disputed.

Number	Date	Tons	SiO_2 %	CaO %
82	August 19	31	4.76	2.37
92	" 20	28	4.56	3.22
98	" 21	23	5.36	2.92

This, on a tonnage basis, gives a mean silica percentage of 4.86.

An analysis of admittedly culled stuff from this dump ran as high as 7.72% silica, and a grab sample of sufficient bulk to run through one of the main jaw-crushers gave a silica content of 5.24%. The point is, that in all this 'sampling' the human equation entered, and there the trouble lay.

On August 22 a further delivery of 34 tons of what was stated to be the same grade of ore from the same stope was delivered, and on mutual understanding this was bulked with the 82 tons above, the whole dump of 116 tons being run through the crusher and an elevator-head sample thus obtained. This gave the following:

Number	Date	Tons	SiO_2 %	CaO %
102	August 22	116	4.38	2.70

This result was manifestly fair and was accepted by both sides. Although the silica content came out materially over the contract limit of 4%, a concession was made and the ore accepted and certified on the 4.38% found.

On August 19 this company had delivered on the switch a car of specially high-grade stuff from their best stope, with the idea of bringing, on a tonnage basis, the silica content of the material in dispute well under the 4% mark. We were notified, and hoped the matter would prove so, as at the moment we were rather overloaded with high-silica stuff. The car was dumped, the usual grab-sample taken, and to the general disgust the silica came out as high as 7.44%. The umpire called in by the X company found 7.35% silica on the same pulp, confirming our finding up to the hilt. Matters had now reached a deadlock: if the ore ran to this figure and persisted, it was unmarketable, and nothing remained but to shut-down the mine.

We were not inclined to pass this carload through the crushers, because that would mean its going on through the kilns, but to settle the matter finally one way or the other to our mutual satisfaction it was arranged to sample by driving into the centre of this dump and taking out 16 wheelbarrows, the contents of these to be passed through the crusher and a shovelful taken every

two minutes at the elevator-head above the crusher, this to constitute the sample and to be quartered and reduced to pulp in the usual way.

Work was started when the night-shift came on, and as the matter was urgent and outstanding, I remained on duty and supervised the operation until the sampling was through and the pulp available and then made the analysis for silica forthwith, that being the deciding factor. The sample was run in triplicate, the three results being 3.80, 3.84, and 3.88%, respectively, giving a mean of 3.84%. The day of grab-sampling at the plant was gone!

It is only fair to add here, by way of comment, that where the ore is of an even grade, but more especially in the case of high-grade ores, grab-sampling may give satisfactory results for the simple and obvious reason that its evenness largely precludes any alarming variation. So far as I am concerned, however, I would not be a party to grab-sampling nor to any system of buying based upon such methods.

Smiling peace now reigned with the X people, but red war broke out with the Y: our troubles were like a miniature Gallic war; no sooner was one group of natives quelled than another rose in arms.

In consequence of the preceding experience we had cut out grab-sampling and substituted a system of fair or representative sampling on the following basis: The Y company delivered about two-thirds of their material in auto-trucks and the remainder in team-wagons. The load was by no means constant and in extreme cases would vary from two to four tons, but would average about two tons and a half. The Z company delivered all their ore in cars on the switch, and a car would vary from as low as 40 tons to as high as 66.

The Y company at this time was delivering an average of about 22½ tons per day, or, say, about nine loads. A wheelbarrow sample was now taken from each load during the course of unloading, and was emptied into a bin constructed for the purpose. The first thing the night-shift did when they came on was to put the day's sample—averaging for the Y company some nine barrow-loads—through the crusher, a shovelful being taken out every two minutes by a man kept at one of the elevator-heads for the purpose. The shovelful was collected as the elevator-bucket turned over and emptied itself, and so contained its normal proportion of fine. The shovelfuls were quartered and treated in the usual way, special care being taken in the matter of mixing and quartering.

Such is, unquestionably, a fairer system of sampling than that previously in vogue, where the human and interested agent selected *what seemed to him* a representative sample, a few pieces in a small tin bucket like a lunch-pail, some 30 pounds to represent as many tons. Reading the matter in type it seems almost too ludicrous for words, and the wonder is that men gifted with ordinary common-sense, to say nothing of considerable mining or business experience, tolerated such an anomalous and absurd state of things for a moment. With the new system and a daily delivery of nine loads yielding nine wheelbarrows of about 150 lb. each the sample would weigh some 1300 to 1400 lb., and of this the portion mechanically obtained at the elevator-head without partiality, favor, or affection, was some 150 to 200 pounds.

Apart from any question of strong mind or strong right arm, the grab system was favorable to either buyer or seller according to which did the 'sampling', for I contend that impartiality under such conditions, especially when you are working close to the market's edge, is a practical impossibility, and the more so as the sampler has knowledge of or interest in the matter. The only objection I know of or that has been raised against the barrow system is that it is not absolutely fair or reliable unless it is carried out on a tonnage basis. This objection I had to grant, and as soon as it was raised I took immediate steps to remedy it, so as to have the work both theoretically and practically as near perfect as circumstances would permit. I defy anybody to show a materially better method, apart from the use of an automatic sampler, that is practicable within the requirements and conditions of everyday work, and difficulties in connection with our yard accommodation made an automatic sampler rather difficult for us to install.

The bone of contention is usually over 'fines', for reasons that will be obvious on consideration of the table of specific gravities already given, coupled with the fact particularly noticeable in the case of the serpentinous grades, which are softer, of the results of abrasion and the apparent readiness with which the more silicious material comes away as dust from the magnesite matrix. Difficulty arises from the use of chutes, especially where the sides are not lined, and some of the wall-material is brought down also. It has been repeatedly objected: "Why, the stope-analysis shows so much, and yet with material almost exclusively from this very stope you are showing so much per cent excess of silica." I refused early to accept the onus of an explanation; it rested with the other side. Let the objector keep side-wall material out of the ore and watch his miners (who are generally on a tonnage basis) that they get out ore only, and this difficulty will cease. Instead of the onus being at the plant it is at the mine, for it is up to the management there to maintain discipline and efficiency, and not to pay for a service or tonnage they do not actually get. To expect the purchaser to pay for, or to explain, inefficiency at the mine is ridiculous in the extreme, and the analysis of ore in the stopes is only dust in the eyes of the blind when the subsequent history of the material is not kept strictly in harmony.

But to return. In the case of the Y company the grab-sample had been taken each morning from the previous day's dump by an employee of that company in conjunction with our sampler, and while the Y boy was neither unreasonable nor intentionally unfair and also was on good terms with our sampler, yet the two of them were not mechanical—they were human. Thus sampling with them was a matter of opinion. Their lad would take what he considered fair, our man would make any objection, if he had any, and would add perhaps a little more of obviously silicious stuff or of green serpentinous ma-

terial if present. They would agree by consent, and thus the 'sample' was obtained.

One fair morning the Syrian came down like a wolf on the fold and we had a pitched battle, the Y and Z people having formed an offensive and defensive alliance for the occasion. The outcome was that the Y people proposed another system of sampling, which, when faithfully carried out, has the virtue of eliminating the human equation, but yet does not yield a fair sample, as it takes no account of the fine, which, in truck-hauling, often sinks in appreciable quantity to the floor. It is a method of surficial sampling, and subject to all the faults inherent. It consists in throwing a net over the surface of each truck-load, and at each point where a knot falls to take a chip of approximately uniform size and to take approximately one pound per ton from each truck. Among other objections, it is too small in bulk to be acceptable. As to a pro rata basis, this yielded one pound per ton, or 0.05% of the bulk, whereas our mode with the wheelbarrows gave (as above) approximately from 1300 to 1400 lb. on the day's delivery of some 22½ tons, or at the rate of some 3% of the bulk. Mathematically, on this basis the odds were at least 60:1 in favor of our method.

For 18 deliveries the material was sampled by both methods and the following table gives the results (silica only) for comparison. It will be noted that in six cases the net method gives the higher results, in the other twelve the wheelbarrow is highest. This has no direct bearing on the correctness of either method, but in view of the remarks above, as to the fine, it is at any rate significant.

Number	Tons	Barrow %	Net %
187–188	41	3.86	4.78
192–193	70	4.26	4.04
200–201	79	4.50	4.68
206–207	54	5.06	4.76
215–216	49	3.92	3.34
218–219	59	5.96	5.72
222–223	24	4.38	2.78
227–228	40	5.10	3.26
233–234	81	4.32	4.68
239–240	47	2.68	3.18
241–242	33	5.30	4.00
249–250	65	5.16	3.54
255–256	31	5.08	4.64
266–267	11	3.72	5.00
270–271	29	5.57	3.90
278–279	57	3.14	3.28
282–283	32	5.04	3.90
294–295	23	3.70	2.30
Total to tonnage basis	825	3709.51	3389.83
Mean of 18 deliveries on tonnage basis		4.50	4.11

Mean difference on long average of 825 tons = 0.39%

We have stuck to our point and method, and its fairness and impartiality have come to be recognized.

We went through much the same set of difficulties with the Z people, modified by the special circumstances resultant on their mode of delivery. They were delivering on the rail in carloads of from 40 to 65 or 66 tons as already described. In their case the material passed through several hundred feet of chute before reaching the car, and while it was pretty well blended in its passage, yet it gained at times no small amount of foreign matter through abrasion of the walls. There is also another difficulty, periodical and seemingly unavoidable, that the chute system involves, at any rate in the case of magnesite ore and ores of a similar type, namely, the fine gathers at points in the chute until it reaches a certain volume, then the normal movement of ore starts it going and an avalanche of fine ensues. This comes down along with the normal ore-feed, and for from three to five cars the amount of fine is excessive and the percentage of silica rises accordingly. Under such conditions a grab, or any form of surface sampling, is totally inadequate, because, owing to the difficulties peculiar to loading, some of the cars come surfaced with high-grade lumps, whereas others are surfaced with nothing but fine. There is no question of 'topping' or tricks of the trade, but the conditions are such that surficial sampling is worthless: it may do with an occasional car, but car in and car out it is worthless.

The following table gives analyses of six different cars sampled, for purposes of comparison, in the two following ways, the first or pick method being in common use among miners and being at the time strongly advocated by the mine manager concerned.

First: An ordinary prospecting pick is taken and the car gone over from one end to the other, measuring time

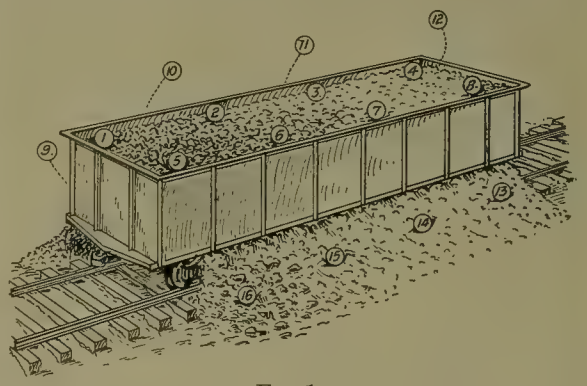

FIG. 1

after time twice the length of the pick handle and, at the place where the point of the pick falls, knocking a chip the size of the top joint of one's thumb off the lump, or, if fine, taking a good pinch of corresponding bulk. When the end of the car is reached, twice the length of the pick-handle is measured off in a side direction and a bee-line made from this point to the first end of the car, similar to that already done, carrying out the chipping process as before at every two pick-lengths. When the whole car has thus been gone over lengthways the process is repeated, but this time from side to side. In this way about 30 pounds of a fair sample of the surface of the car is obtained, but it is only a surficial sample—anything may be underneath.

Second: Sixteen wheelbarrows are taken out of the car as shown below in the diagram, eight at regular intervals over the top, four a side, digging well into the material to obtain them, and other eight from the ground, four a side from either side of the car, when the car-bottom is opened for dumping.

This dump method appears to be as just and representative a mode of sampling as can be devised, and is now thoroughly endorsed by the Z company. It may be

added that, with their system of chutes, the ore generally lies in the car with the fine more to one side and lumps to the other, and this is recognized in the dump method, which is as mechanical as possible in view of the circumstances involved.

Number	Tons	Pick %	Dump %
164–166	51	3.73	3.23
205–204	52	3.12	3.20
213–221	50	5.20	3.40
399–412	63	5.10	3.60
402–403	64	3.31	3.60
406–411	60	5.40	2.67
Total to tonnage basis	340	1469.61	1118.53
Mean of six deliveries on tonnage basis		4.32	3.29

Mean difference on long average of 340 tons = 1.03%.

As to the ratio of sample, 16 wheelbarrows represent from one ton and a quarter to one ton and a half, or, say, an average 2½% sample of bulk, as against some 30 lb., or, say, 0.025% of bulk.

Regarding ore and commercial sampling as a whole, there is in my laboratory a 'sample' weighing rather less than an ounce and a quarter. Almost all orebodies that I have seen are non-homogeneous, but magnesite is especially heterogeneous. In view of this fact and the remarks supported by figures at the commencement of this article as to the need for a sufficiently large number of particles, or correspondingly of pieces if they run large, I think the commercial valuelessness of an analysis of such a small sample, and the folly of the practice, will be evident.

CHEMICAL CONTROL is a serious item of expenditure, and such control either exists or it does not. In many cases, not necessarily limited to magnesite, it is so set off by faulty sampling as to be little better than a farce. As a case in point: the superintendent of another plant recently complained to me that he could not understand the silica question, it was a mystery to him. The material that passes through his kilns "grows" (to use his wistful expression) something like 1% SiO_2 in the process of calcining: if it enters 2% crude, it comes out calcined 5%.

Now the CO_2 content of chemically pure $MgCO_3$ is, from the formula, 52%. The ignition loss on a standard sample of magnesite ore (pulp) we make use of for purposes of standardizing and comparison is 48%. On this 48% basis 100 tons of ore should calcine to 52 tons product. In practice there is a loss due to discrepancies in weighing, dust removed in the dust-chambers (silicious dust), dust carried to the atmosphere through the smoke-stacks, loss of alkali through volatilization at the high kiln-temperatures, so that over a long average it requires 2.19 tons crude ore to produce 1 ton of calcined material, or 100 tons yield 46 tons of product.

On this basis 2% crude should calcine to 4.38%. Assuming, however, that on a day's run of 150 tons some 5 tons of 12% silicious dust has been taken out by the dust-chamber, this means a loss of actual silica of 0.60 ton, which is equal on a percentage basis to a loss of 0.40% SiO_2 on the crude. This, as a practical man will see at a glance, will vary with the silicious content of the crude, and seeing that we are discussing high-grade stuff (2%) we can afford to cut the figure in half. We are still left with a loss of 0.20% SiO_2, that is, our 2% material should calcine to $4.38 - (0.20 \times 2.19) = 3.94\%$, or, say, in round numbers, 4% SiO_2, and if it does not the fault lies with the sampling. It is scarcely probable the chemist is in error in such a case, his error on a long average is likely to pretty well cancel itself, and further, any error in the analysis of the crude would tend to cancel itself or be disguised by repetition in the case of the calcined, and thus pass undetected.

Sampling of the calcined ore presents its own problems. The material is kept under check by analysis as it goes to the cooling-floors and finally as it is loaded into the cars for shipment. All the loading is done by wheelbarrows, but an elevator system with mechanical sampler is advisable and is indispensable in the design of an improved plant.

A mix is effected by combining the running of the kilns, such that the mixture on the cooling-floors will just hit the specification desired. In addition to the mixing incidental to the process of crushing, a further blending occurs in each of the kilns owing to the rotary motion during calcining, followed by the movement up the runways, the fall from the cooling-tower, and descent to the floor. Despite all this, grab-sampling taken on the floor or at the kilns shows surprising variations, and grab-sampling gives no more consistent results here than it does in the case of crude.

Originally, cars for shipment were sampled by taking out some 30 pounds or less in two stages during the loading of the car. This 'sample' was the usual gamble based on the personal judgment of the sampler, and the 30 lb. had to represent a carload of some 50 tons. This was changed to getting out a total of two wheelbarrow loads at three or four stages during loading, when the car was respectively one-quarter, one-half, three-quarters full, and finally completed. This was an improvement, but it was still possible to obtain two samples from the same car that showed excessive variation.

This was changed to taking a shovel out of each wheelbarrow as it goes to the car for loading. This gives the longest average and the fairest distribution of error that it is perhaps possible to obtain outside a mechanical sampler; in fact, from the standpoint of experience it is doubtful if even a mechanical sampler would do better. The following six analyses are of cars that were sampled recently for comparison by the two methods. In either case (A) is the four-stage method mentioned in the preceding paragraph, and (B) the long-average method described in this paragraph.

	Ignition loss %	SiO_2 %	CaO %	R_2O_3 %	MgO %	Total %
(A)	4.26	4.84	3.28	1.36	85.45	99.19
(B)	4.46	5.80	4.04	1.56	85.02	100.88
(A)	1.94	6.08	3.64	1.52	85.60	98.78
(B)	1.92	6.16	4.00	1.40	86.32	99.80
(A)	2.28	6.00	3.58	1.92	86.22	100.00
(B)	2.88	5.68	4.14	1.72	85.58	100.00

Various reports reached us as to the methods of sampling in vogue in the East, and we were rather unwilling to give them credence on account of the extraordinary laxity shown. However, the matter was confirmed in conversation with one of the Eastern buyers recently at the plant, and one has a feeling of hardship in knowing that

after all the scrupulous care that has been exercised at this end in the endeavor to sample fairly, one may be up against some happy-go-lucky hit-or-miss method at the other end.

Careful quantitative investigation at the plant has shown that magnesite after being calcined but not actually sintered takes up both water and CO_2 along a regular curve. In the case of sintered magnesite the take-up is practically negligible. Specimens of calcined material are mailed out in two-ounce bottles, pulp or granulated, carefully quartered from a large bulk, the cork and neck of the bottle being hermetically sealed by dipping in melted paraffin wax, and the whole then enclosed in a four-ounce mailing-tube.

While the above was in the Editor's hands I had further experience along the via dolorosa, this time with manganese ore (pyrolusite). Out of some dozens of instances that might be tabulated the following two illuminating cases are quoted, being the two most recent at the time of writing. They represent two distinct carloads from different mines and localities, loaded differently, hence there should be, and is, a call for special care in the crucial matter of sampling. A little thought will convince that one fundamental radical sample would be a material economy both as to unnecessary labor, wasted time, uncertainty and expense, than three botched attempts, for the three botched attempts merely serve to make trouble. Analyses are by me save where otherwise stated.

1. A box-car, apparently loaded at the mine from a chute that was diverted from one end of the car to the other during loading process, the ore in consequence

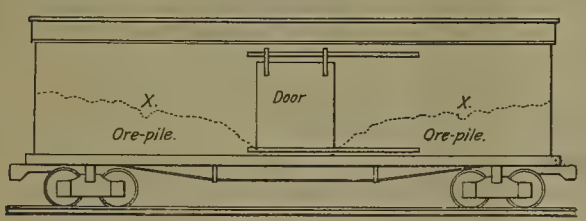

Fig. 2

lying as shown in Fig. 2, which represents a longitudinal section.

This car was actually sampled four times—once by the vendor, and three times at the smelter! Sample A is the vendor's: in B the 'sampling' was from the surface and taken by the regular sampler as fairly as working-conditions permitted: in C a good hole was dug at the two points marked x and a substantial sample removed in a wheelbarrow; D is what is here termed an 'unloading' sample and is obtained after the material has passed through the crusher, one shovelful being taken from each car on its way up to the bins. The bulk of A, the vendor's sample, is not known, so that its factor cannot be argued on: the bulk of B is 120 lb., or about 0.12% of total: the bulk of C and D is practically the same—one wheelbarrow—something like 0.2% of the bulk, and well distributed, thus considerably augmenting the mathematical difference in the factor of safety.

	A	B	C	D
	%	%	%	%
Manganese	41.15	39.90	34.77	36.60
Silica	17.20	16.18	31.62	30.74

Samples C and D carried fine, whereas B was practically fine-free: by comparison of results it would appear that A also was free from fine stuff.

2. An open flat car: A is practically a surface sample, B is an unloading sample similar to D above.

	A	B
	%	%
Manganese	39.16	44.41
Silica	34.64	25.92

3. The following was taken a week or two before my arrival at the plant, and is given as a further instance of variation in three samplings. The method employed in the various cases is not recorded.

	A	B	C
	%	%	%
Manganese	32.50	43.85	31.49
Silica	38.95	23.54	34.70

There is something rotten in the state of Denmark! What basis does this solemn farce give for metallurgical calculations? Such a state of things is mingled gambling and child's play, and is innocent alike of calculation, method, or exactness. Metallurgy is a peculiarly sensitive process, or combination of processes, and the results should be closely quantitative. To work to such a thing as a close slag-eutectic is impossible under the conditions outlined, rather, in the language of Kipling, you're "thankful you're living and trust to your luck."

Dealing with the silica in case No. 1 above, the obvious limit of sampling-error varies between a maximum of 15.44% and a minimum of 6.77% respectively of the total. Or for emphasis, if the finding (16.18% SiO_2) in sample B were correct, then the sampling error in C in terms of SiO_2 amounts to no less than 95.4%. Further comment is unnecessary.

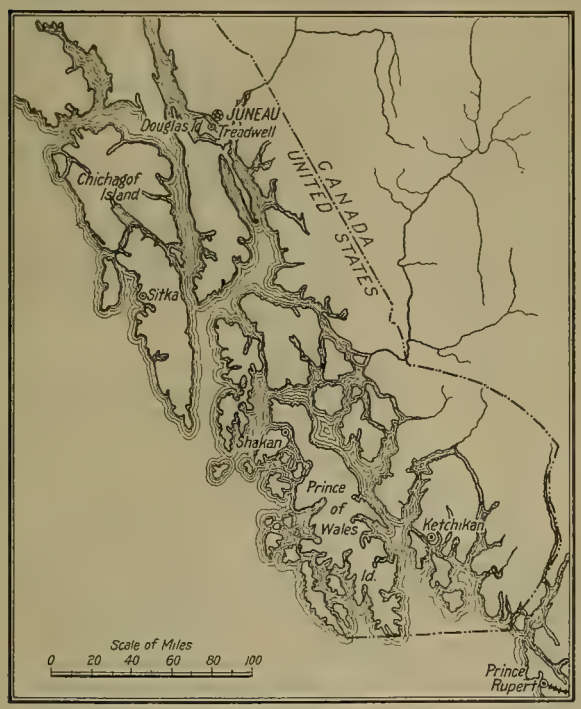
On such a crazy foundation accurate and expensive analyses are performed and scientific control is supposed de facto to exist. When will the prime importance of sampling come to be fully recognized, or are we to continue forever to "trust to our luck"?

The greatest depth at which mining is now done on the Rand is 5634 feet vertical, equal to sea-level. These workings are on the main incline from the Turf Mines shaft of the Village Deep. The South African 'Mining Journal' says that "all the natural obstacles to working at this depth have been successfully overcome. The rock pressure proved the chief trouble, but this has been met by the special methods of support adopted. The increased heat has likewise been offset by adequate ventilation. In regard to the value of the ore exposed in development at this depth it is interesting to note that it is said to justify the favorable anticipations by H. F. Marriott, recently published. Another feature is the fact that the improved Whiting hoists have worked most satisfactorily, thus considerably simplifying the problem of winding at great depths."

JUNEAU, ALASKA

Physical and Financial Condition of the Alaska Treadwell and Alaska Juneau Properties.

Another report of F. W. Bradley, president of the Alaska Treadwell, Alaska Mexican, and Alaska United gold mining companies, has just been issued. As is generally known, the Treadwell, Mexican, and 700-Ft. Claim mines were flooded



MAP SHOWING SITUATION OF THE SHAKAN MOLYBDENITE MINE, PRINCE OF WALES ISLAND, AND TREADWELL, DOUGLAS ISLAND

by the sea on April 21, 1917, since when only the Ready Bullion mine has been worked. All of its openings beyond the shore-line are under the deep waters of Gastineau channel. All openings are being filled in order to make the mine safe. This has cost $120,000, to prepare for the filling, while it will cost 15c. per ton to secure rock and dump it underground. The shaft is down 2800 ft., and cross-cutting is in progress. Ore-reserves above 2600 ft., plus the probable above 2800 ft., total 2,300,000 tons, of which 1,400,000 tons will be recovered. If pay-ore is found at 2800 ft. sinking will be continued to 3400 ft., the limit of the present hoist. If the bottom turns out profitable, driving west will be continued to prospect at depth any extension of the Treadwell-700-Mexican orebodies. If sufficient is then found, high tides will be dammed from the break on the shore of Gastineau channel, the old workings pumped out, and mining conducted through the Combination shaft, which is in solid ground. This would be in 5 to 10 years' time.

During the 9 months ended September 30, 1918, the Ready Bullion mill treated 328,990 tons yielding $724,686. The cost was $826,819, including $54,692 for shaft-sinking and shaft-house, etc., and $126,429 for safeguarding the mine against salt-water leaks.

Financial statements for the three companies during 1917 and the first half of 1918 may be summarized as under:

	Alaska Treadwell	Alaska Mexican	Alaska United
Receipts in 1917	$2,370,800	$212,924	$771,554
Expenses in 1917	1,999,179	149,680	861,789
Final excess of receipts	371,621	63,243	.....
Final excess of expenses	.....	.....	90,235
Receipts, half of 1918	441,719	35,033	190,499
Expenses, half of 1918	418,006	37,934	284,622
Final excess of receipts	23,712	.....	.....
Final excess of expenses	.....	2,900	94,123

The Treadwell company's mercantile business made a profit of $76,755 in 1917, and $23,207 in the first half of the current year. Supplies are valued at $538,039. Dismantling and marketing saleable equipment up to June 30, 1918, amounted to a profit of $294,398. There is still $209,950 of material available.

A 2-ton Heroult electric furnace was erected at the foundry for making steel castings; also for making ferro-molybdenum from the company's Shakan mine, and probably for making ferro-chrome and ferro-tungsten from Alaskan ores. The Shakan mine is on Prince of Wales island, B. C., and contains 100,000 tons of ore. Detailed reference will be made to this property in another issue of this journal.

In a report dated November 23, 1918, F. W. Bradley gives some interesting information concerning the Alaska Juneau property:

As far as the mine is concerned, there have been no changes for the better or for the worse since the publication of the company's official statement of April 2, 1915; but we have been in trouble with the new mill, which, as stated in the last annual report to the stockholders, has at its best been able to accomplish less than one-half of its promised capacity at an operating cost per ton of over twice the expected cost.

This mill, as originally designed and erected, contained many experimental features that have turned out to be unsuitable for Alaska Juneau ore, and we have been struggling with the problem of how to make the most advantageous use of the mill. With no funds and a shortage of labor, the solution of this problem has been slow and difficult; but work is now under way on definite plans for so altering the mill as to reduce its operating cost to a figure comparable with other milling costs in the Juneau district, also for enlarging the mill so as to bring its daily capacity up to 8000 tons of ore as originally promised. It is estimated that these alterations and enlargements can be carried out at a further expenditure of not to exceed $500,000, in accordance with the program herewith submitted; and that when completed, the property can then earn an operating profit of $1,400,000 per year as originally estimated.

At the time the mill started, on March 31, 1917, all the company's funds had been expended, and there was an indebtedness of $141,226. At the end of 1917, this had increased to $1,015,934, with the progress accomplished as stated in the last annual report. Since January 1, 1918, in-

cluding October (estimated), results have been as under:

Month	Tons	Gold assay-value, cents	Recovery %	Gold recovered including absorption clean-up	Milling costs cents
January	118,809	69.52	75	$61,905	43
February	97,156	68.51	75	49,790	53
March	56,222	82.36	79	36,749	65
April	54,147	72.27	78	30,398	57
May	57,865	71.09	78	32,088	52
June	22,740	104.21	82	31,205	100
July	23,226	186.30	87	47,335	97
August	23,441	143.60	85	29,176	101
September	21,045	132.85	85	23,851	117
October	24,210	113.00	80	34,210	87
Totals and averages	498,861	86.50	79.5	$376,707	63

The corresponding figures for the entire year of 1917 are: 672,424 tons, 87.50 cents, 74%, $470,534, and 56.11 cents.

Of the gold recovered in the above 10 months of this year, $33,567 came from the absorption clean-up and should properly be apportioned to the tonnage crushed in 1917.

The lead and silver value is not included, as it is practically offset by the freight and treatment charges on the concentrate.

Mining and tramming costs this year averaged 38c. per ton, milling 63c., and other expenses 10.1c., a total of $1.111 per ton. All operations cost $554,549, plus $93,686 at Juneau and $74,664 at San Francisco and New York, making a total of $722,899. Adding the operating losses for 1918, San Francisco and New York, and the Juneau extraordinary charges (including $55,615 for mill, $25,231 for preparatory mining, etc.) to the indebtedness on January 1, 1918, the total owing at October 31 was $1,347,068.

In order to secure the amount still necessary to complete correcting the defects in the milling plant, in order to fund the debt and for other purposes, Mr. Bradley suggested a meeting of the stockholders be called on January 10, 1919, for the purpose of authorizing an issue of $3,500,000 of first-mortgage ten-year 7% gold bonds, to be disposed of as follows: (1) $1,500,000 or so much thereof as may be necessary to be exchanged at par for outstanding obligations and floating indebtedness of the company; (2) $500,000 to be sold at not less than par to bondholders, stockholders, or the public, at such times and in such amounts as may be required in order to complete the alterations and enlargements of the milling plant already planned and now under way; and (3) the balance to remain in the treasury, to be used from time to time as may be required for the following purposes:

As it is thought that it will require two years to place the mine on a paying basis, Mr. Bradley recommends that for the first two years, interest on the outstanding bonds shall be paid in scrip or cash, at the option of the directors. If they determine to pay interest in cash, and the earnings of the property are not sufficient to supply necessary funds, bonds to the extent necessary to supply any deficiency may be sold at par and proceeds used for this purpose. If scrip is used for the purpose of paying interest, it may be exchanged at par for bonds. Sufficient bonds for these purposes shall be set aside. Also said bonds, or so much thereof as may be necessary, shall be subject to sale at par at the discretion of the directors, for the purpose of acquiring additional property, increasing facilities, and providing for possible operating losses during the two-year period estimated for completing alteration and enlargement of milling plant, and placing the property on the operating earning basis originally estimated.

With the end of the War, there has been an increase in the supply of common labor in the Juneau district, and it is reasonable to expect a sufficient increase in the supply of skilled men to complete the milling plant in two years' time after the necessary money for the work has been secured. Therefore, it would seem safe to provide for a sinking-fund to commence at the end of five years or sooner, at the option of the company. Also it would seem advisable to provide for redemption of the bonds at any time at the option of the company upon payment of par and 10% premium.

CRIPPLE CREEK, COLORADO

Orebodies Found by Work From the Drainage-Tunnel.—Cresson has Another Large Shoot.

Another important discovery has been made in the property of the Portland company on Battle mountain at the Roosevelt tunnel, at a point 1800 ft. from the main opening, a distance of 130 ft. north-west of the Portland No. 2 shaft, an approximate depth from surface of 2100 ft. The cross-cut being extended to connect with the shaft passed through the Lee No. 5 vein of the Hidden Treasure system. Samples assay from 3 to 6 oz. per ton. The shaft is now within 30 ft. of the tunnel-level, at this point 2137 ft. in depth, and an elevation of 8107 ft. The elevation at the collar of No. 2 is 10,244 ft. Five distinct orebodies have now been opened at the tunnel-level; two in the Cresson on Raven hill, two in the Portland, and one in the Rose Nicol.

The Reva Gold Mining Co., operating the Rose Nicol, in the past week made an important development at the eighth or 1000-ft. level of the Rose Nicol shaft. A vein 10 ft. wide has been exposed by cross-cut, and mine samples show an average of 1 oz. per ton.

The Cresson company reports another important strike in stope 1105, above the tenth level, where ore is now being broken 10 ft. wide and 60 ft. long, carrying $40 to $50 per ton. When the stope was first opened the orebody was 20 ft. wide, but pinched to a narrow streak of less than 3 ft.; but has again grown to large dimension, at a point 28 ft. below the 9th level in virgin ground above. The company now has 30 machines at work; the labor shortage due to the influenza is showing improvement.

The November production from the United Gold Mines Trail and W. P. H. mines totaled close to 1000 tons of $25 ore. One car from the Wild Horse dump returned $15 per ton.

TONOPAH, NEVADA

Recent Developments in the Divide District.

Ore shipments from the Tonopah Divide mine to the Goldfield Consolidated mill have been increased to 300 tons weekly. It averages $30 per ton, and settlement is made on a basis of 92% extraction. A. I. D'Arcy, the consulting engineer, places an estimate on the ore-dump at the shaft at 6000 tons assaying $30. This is based upon continuous sampling during mining. Most of this ore is from the 165-ft. level, and contains molybdite, the yellow oxide of molybdenum. Owing to its excessive cyanide consumption this ore is not being sent to the mill. The molybdenum metal in the ore on and below the 265-ft. level is powellite, a calcium molybdate, and is not soluble in cyanide or any alkaline solution. Except for rich seams or pockets, the amount of the metal is small, and no effort has been made to effect its recovery. If it is found on deeper levels in quantity and in sulphide form, a by-product recovery can be made by flotation. Drifts on the three main levels continue in good ore, and Mr. D'Arcy reports greater uniformity of value on the deepest or 370-ft. level than on the levels above. Ore now being sent to the mill is that extracted in blocking the main orebody by means of cross-cuts and raises at 50-ft. intervals at the 265 and 370-ft. levels. The main shaft is being sunk from the 370-ft. level, and for this work an auxiliary electric hoist is used. Rock broken in sinking is dumped from the bucket into cars at the 370-ft. level, and hoisted in the cages. South of the shaft 570 ft., the cross-cut on the 265-ft. level penetrated what is known as the gold vein, from which high-grade gold ore was taken

near the surface during the early period of activity at Goldfield. A drift east on this vein has opened from 2 to 3 ft. of ore assaying $40 to $75 gold, and has reached a cross-fault where the face showed 5 ft. of good ore. This vein has a trend due east, while that of the silver vein is approximately south-east, and surveys point to a junction of the two within the Divide company's ground, near the south-east end-line. The gold vein dips north at an angle flatter than the silver vein, which is nearly upright, and a cross-cut is to be driven to the gold vein on the 370-ft. level. Old workings on the gold vein, at the outcrop, are nearly 100 ft. above the collar of the main Divide shaft.

In the Gold Zone property, adjoining the Divide on the south-east, a drift on the 295-ft. level followed the Divide vein to the joint end-line, where the face sampled $11 per ton. The Gold Zone shaft is being sunk to reach the 500-ft. point.

The Brougher Divide, adjoining the Divide on the north-west, has prospected the main vein for a considerable distance on its 170-ft. level, corresponding in elevation with the 265-ft. level of the Divide, but has found no pay-ore. The shaft is now being sunk another 200 feet.

On the Tonopah Dividend, north-west of the Brougher Divide, cross-cuts have been driven east and west to the two parallel lodes on the 300-ft. level. The company has excellent equipment, has constructed a good road to the property, and has a private telephone line to Tonopah.

The Hasbrouck, in the south-western part of the district, has produced a considerable quantity of shipping ore, and has some ore of good grade in the shaft workings, while the tunnel is said to have cut the main vein.

The East Divide, east of the Gold Zone, is sinking with good equipment. The shaft is down 150 ft., and will be continued to 300 ft. before lateral work is started.

GRAND FORKS, BRITISH COLUMBIA

New Work in Grand Forks and Similkameen Districts.

Recent reports indicate that there has been considerable activity in the Grand Forks and Similkameen districts during the past year. In addition to the extensive development being carried out by the Canada Copper Corporation at Copper Mountain, there are many smaller properties that are promising. Some brief reference to these follows:

The Emma copper property in the Grand Forks division is controlled by the Consolidated M. & S. Co. E. Nordman is superintendent. Work totaling 1704 ft. cost $56,340.——The Rock Candy fluorspar mine in the Grand Forks division, also owned by the Consolidated M. & S. Co., has done 492 ft. of diamond-drilling and some underground work. A boarding-house and office has been erected. A wagon-road was constructed at a cost of $10,000, also ore-bins and an aerial tram, the total representing $25,000. Reduction works having a capacity of 100 tons per day may be erected at the railroad terminal.——The Copper Farm group of copper-silver claims, in the Similkameen division, owned by the Princeton Mining & Development Co. of Princeton, has been doing considerable development during the past season. The daily output is 50 tons. A 3-drill compressor and 150-ton ore-bin are among the plant contemplated.——At the Berlin gold-silver claims of the Inland Mining Co., Paulsen, Grand Forks division, the cost of recent work is placed at $4600.——The Efanjay Gold Mining Co. of Spokane has leased to the Placer Development Co. of Tulameen some placer ground on the Tulameen river on which considerable work has been done chiefly for the recovery of platinum, also gold. A dam, flume, and sluices cost $20,000.——The Mastodon, Dominion, and Pan chromite property, Grand Forks division, has been acquired by the Stewart-Calvert Co., Inc., of Oroville, Washington. Work estimated to have cost $6600 was started last July. Eight hundred tons of ore has been shipped.——The Regal group of 10 copper claims, in the Similkameen district, has been developed to some extent, costing $7000. The daily capacity at present is placed at 250 tons.

Victoria.—Sales of Crown-granted mineral claims, in arrears for taxes, are being advertised in different parts of British Columbia. Since the outbreak of war, the regulations in regard to Provincial dues have not been rigorously applied; but from now on the authorities are likely to demand strict compliance with the law. This, of course, does not mean that the terms of the Allied Forces Exemption Act, which protects soldiers, sailors, and their relatives while the former are on active service, are to be cancelled or in any way disregarded.

TORONTO, ONTARIO

Employment for Munition Workers.—Outside Fields.

The munitions industry of Canada, which recently gave employment to 200,000 men and women, has come to an end. All initial work on shells for the Imperial government ceased on November 15, and the processes now in hand must be completed by December 14. Some of the plants working on orders for the United States government may continue operations for a short time, but these contracts may soon be cancelled. The problem of transferring the unemployed workers to peaceful industries with the least possible friction or delay is receiving the close attention of the Government. As the result of conferences between members of the Cabinet and the heads of the railroad, steel, and car-building industries, it has been demonstrated that this can easily be accomplished. The railroads are considerably short-handed, and the needed work of maintenance and improvement has been postponed until after the War. Rolling-stock is badly needed, and car-constructing companies are eager to increase their working forces. In fact, nearly all of the important industries are in the same position, so that all the labor released by the closing of the munition plants is being rapidly absorbed. Of the 25,000 munition workers in Toronto, 6000 have already been discharged. Many of the manufacturers are taking up or reverting to other lines of production, and will retain a large proportion of their staffs. The shipbuilding and agricultural-implement industries offer employment to a large number, though usually at considerably lower wages than the men have been receiving for munition work.

The mine-owners of northern Ontario have been requested by the Government to aid in the work of reconstruction by absorbing all the labor they can employ, a rather unnecessary procedure, considering that the operators have all along been anxious to increase their forces. A good many of the men lately employed in the munition plants have already found their way to the mines and been taken on. The shortage of labor was recently estimated at 50% at Porcupine and 10% at Cobalt. This, it is anticipated, will be made good before spring.

Gowganda.—A large body of high-grade ore has been found on the 490-ft. level of the Miller Lake-O'Brien. The vein is 12 in. wide, and is said to carry 4000 oz. of silver per ton. Besides this there is a good width of milling ore.

Kirkland Lake.—The main shaft of the Elliott-Kirkland, now down 500 ft., will be continued to 600 ft., diamond-drilling having shown an increase in the extent of the porphyry formation at that depth.

Boston Creek.—A new vein, 3 ft. wide, carrying tellurides, has been opened on the surface at the Cotter property. The eastern continuation of the Miller Independence vein on this location is being explored by drilling. The vein has been cut at depth, indicating a width of 6 ft., showing visible gold. Some rich ore is being bagged.

ALASKA

Juneau.—Alaska Gastineau in November milled 94,395 tons of ore assaying 96.8 cents per ton. The recovery was 79.55%. This is an improvement in tonnage over October, when it was 75,870 tons. A year ago the quantity was 175,960 tons averaging $1.08 per ton.

Kennecott.—The Kennecott Copper Corporation pays $1 per share on December 31.

ARIZONA

Ajo.—New Cornelia produced 3,264,000 lb. of copper in November, 500,000 lb. below the average. At the meeting of the American Institute of Mining Engineers at San Francisco on December 10, L. D. Ricketts showed moving pictures of all operations of this company.

Bisbee.—Shattuck-Arizona produced 583,655 lb. of copper, 514,125 lb. of lead, 11,296 oz. of silver, and 86 oz. of gold during November.

The Phelps Dodge Corporation has declared distrubitions totaling $8 per share.

Calumet & Arizona yielded 3,898,000 lb. of copper during November, the lowest output of the year by 300,000 lb., excepting in February.

Clifton.—Arizona Copper Co. produced 4,000,000 lb. of metal during November.

Douglas.—The Phelps Dodge properties in November yielded a total of 15,785,011 lb. of copper. The average monthly output for the year is 18,000,000 pounds.

Duncan.—The Goldfield Consolidated company of Nevada has stopped exploration of its Ash Peak property west of this place.

Globe.—Old Dominion produced 2,101,000 lb. of copper in November, lower than usual.

Humboldt.—A 100-ton concentration and flotation plant is to be erected by the Silver Belt Consolidated Mining Co. There is 40,000 tons of good-grade ore on the dump, left from former operations.

Jerome.—The influenza was bad here, there having been over 900 cases and 82 deaths. At present (December 3) the epidemic is well under control and only 7 cases are under treatment, most of these being convalescents from pneumonia.

The Verde Combination is to sink its shafts 200 ft. below the 1080-ft. level. Twelve headings have been run on this level, most of which have exposed ore, the best showing at present is in the station and cross-cut. The report of the manager, David Morgan, for the year ended October 31, 1918, shows that 5039 ft. of work was done at a cost of $16.67 per foot; shaft-sinking—402 ft.—cost $63.91 per foot; station cutting cost $15.54 per cubic yard. Cash assets amount to $183,814.

Ore is still being shipped from the Maintop of the Jerome Verde, but the quality is somewhat inferior to that of a few weeks ago when the copper content ran above 10%. Several stringers of solid chalcocite have been cut, and they are now working on the 7th floor up from the 900-ft. level. Diamond-drilling and exploration near the Maintop orebody are under way, although nothing of note has been exposed.

Although extremely hard ground is being encountered, shaft-sinking at the Grand Island property is proceeding as well as could be expected and a depth of 380 ft. has been reached in the three-compartment shaft. It is intended to sink to the 500-ft. level, from which point a cross-cut will be driven to cut the vein exposed on the 200-ft. level.

Metcalf.—Shannon produced 684,000 lb. of copper in November. This is the lowest return for the year. In January it was 972,000 pounds.

Miami.—Inspiration Consolidated produced 7,500,000 lb. of copper in November. Since the 10,300,000 lb. output in June there has been a steady decline, due to various causes. At the meeting of the American Institute of Mining Engineers at San Francisco on December 10, L. D. Ricketts showed excellent moving pictures of underground and surface operations at the Inspiration and International smelter.

Oatman.—United Eastern pays 7c. per share on December 28. This is equal to $95,410.

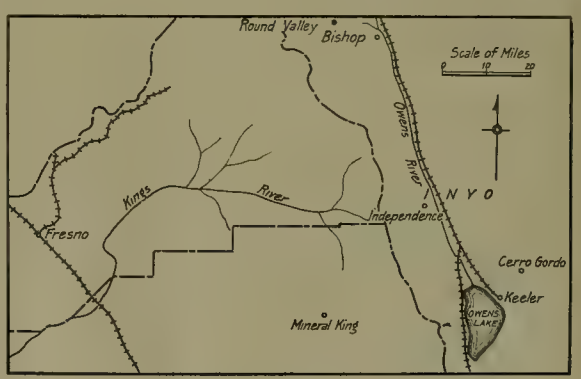
Ray.—On December 31 Ray Consolidated pays 75c. per share, making the 1918 total $3.25. In 1917 the distributions totaled $4.20 per share. Copper output in November was 7,020,000 lb., 300,000 lb. below the average.

ARKANSAS

Yellville.—Zinc mining in northern Arkansas continues fairly busy, in spite of low prices for ore. At the Hawkeye in the Rush district a 500-ton mill has been erected. This produces a high-grade concentrate. Crawford brothers and others of Little Rock and Benton are the principal owners.

CALIFORNIA

Bishop.—Twenty miles from this place, at an elevation of 11,000 ft., is the Pine Creek tungsten mine, according to the 'Bulletin' of the Los Angeles Chamber of Mines and



THE TUNGSTEN DEPOSITS OF INYO, CALIFORNIA, ARE CONTIGUOUS TO BISHOP

Oil. The property is in a region difficult of access. A road was constructed and a 17-mile transmission-line erected. Ore-reserves are estimated at 200,000 tons, averaging

1.34% tungstic oxide. In undertaking to open and equip the property, it was necessary to carry out the following: opening the mine by tunnel, drifts, and winze to glory-hole; erection of a 3-rail gravity tramway 2200 ft. long between the mine and the mill (difference in elevation 700 ft.), with ore-bins at both ends; erection of a concentrating mill with a capacity of 300 tons per day; and the laying of a 2000-ft. pipe-line from a lake to the mill for water-supply. The mill includes one 20 by 10-in. Allis-Chalmers improved Blake crusher; one 24 in. by 5-ft. Allis-Chalmers improved apron-feeder; two 5 by 4-ft. Allis-Chalmers ball-granulators, fitted with patented open-end combination-feeders; 3 Colorado Iron Works impact-screens; a series of five Overstrom universal concentrating tables; hydraulic classifiers; elevators, etc. In 75 days the whole plant was erected, in spite of unusual difficulties. Alvin B. Carpenter was in charge of all operations.

Copper City.—The Baxter mine, one of the Bully Hill group, is shipping ore to the Kennett smelter. The mine is under lease to J. W. Schoonover, Lem Williams, and Dan Harrigan.

Oroville.—The Natomas company has shut-down its No. 2 dredge on the Feather river. After working for nearly 11 years the hull is in bad condition. Two other boats will finish the ground remaining. G. W. Akers was dredge-master. Only two dredges are now working in the district.

Trinity Center.—The hull of the new wooden dredge of the Estabrook Gold Dredging Co. was launched here on November 28. The hull is 152 ft. long, 68 ft. wide, and 23 ft. deep. This boat will take the place of an old one that was worn out and sank early in the year. It is expected that the new boat will be ready for operation by April 1, provided all the machinery can be hauled in from Redding before snow falls.

Winthrop.—The Bully Hill new flotation plant is working satisfactorily.

COLORADO

Central City.—The Pilgrim Gold, Silver, Copper M. & M. Co. has bought the Two Forty mines in the Russell district. Boston capital is largely behind the business. The Argo tunnel lies close to the claims at a depth of 1500 to 1700 ft. The property has been opened by tunnels and shafts. A motor-driven compressor is to be erected. The mill, built on the hill-side, contains 10 stamps and a flotation plant.

Ouray.—Camp Bird Limited announced in London on November 26 the following: "Stretch 20 ft. long; width 12 in.; sample 2 to 3 oz. gold and 10 to 20 oz. silver." This ore was found in exploring from the long adit. Shares in London jumped from 3s.6d. (84 cents) to 17s. ($4.08) in one day.

IDAHO

Hailey.—Developments at the Independence mine of the Federal M. & S. Co. are reported to be very encouraging. One ore-shoot is over 200 ft. long and 600 ft. deep on the dip of the vein. The daily output of high-grade ore and concentrate is 25 tons.

Mullan.—At the National copper mine a winze is down 65 ft. below the 1500-ft. level. It has been following a shoot of 1½% ore. A good body has been opened on the 800-ft. level, while there is a large quantity of ore broken above the 800, 1200, 1400, and 1500-ft. levels. The flotation mill is working one shift but the manager, Charles McKinnis, expects it to be running full time at half capacity by the new year.

MISSOURI

Joplin.—Assayers in the zinc-lead districts have agreed to charge to the purchasing company all umpire or third samples. There has been a good deal of dissatisfaction over this question, the assayers frequently receiving nothing from either buyer or seller for the umpire assays, which cost from 75c. to $1 each.

Production of the Tri-State region last week was as under:

	Blende, tons	Calamine, tons	Lead, tons	Value
Kansas	31	...	242	$20,842
Missouri	749	341	118	60,371
Oklahoma	3,471	...	837	237,295

Average prices were $48, $38, and $80 per ton, respectively. Smelters purchased 10,000 tons at $45 per ton, about double the weekly quantity under the agreed price.

MONTANA

Butte.—Fire broke out on the 900-ft. level of the Colusa-Parrott mine of the Anaconda company on December 11, but the management expected to have it under control the next day. Men from adjoining mines were withdrawn early.

East Butte pays $1.50 per share on December 21. East Butte produced 2,050,000 lb. of copper in November, up to the average, and equal to that of the same month in 1917.

The November output of Butte & Superior was 9,500,000 lb. of zinc and 185,000 oz. of silver. The recovery was 94%. In September the yield was practically similar, but all other months have been above 11,000,000 lb., save in May, when it was 6,850,000 pounds.

Anaconda produced 22,600,000 lb. of copper during November. Save the 21,800,000 lb. in September, the outputs have steadily decreased from the 28,400,000 lb. in May. Influenza and the other factors have hindered operations.

Clancy.—The Legal Tender Mining Co. has a new shoot on the 200-ft. level. It carries high-grade silver ore next to a dike and is distinct from any other shoot worked in the past. Six men are taking out ore, the best of which assays 1000 oz. per ton.

East Helena.—The Economy Gold Mining Co. expects to have its 125-ton concentrating plant in operation early in 1919 at the mine in Mitchell gulch, south of this place.

Great Falls.—The Anaconda company's ferro-manganese plant, newly erected by October 15, was shut-down indefinitely on the sixth.

NEVADA

Ely.—Nevada Consolidated pays 75c. per share on December 31. This makes $3.25 for 1918, compared with $4.15 last year. During November the copper output was 6,601,000 lb., nearly up to the average.

Pioneer.—The Consolidated Mayflower mine has been taken over by J. H. Miller of the Western Ore Purchasing Co., and associates. J. B. Kendall recently examined the property, his samples averaging high. The main shaft is 530 ft. deep. The mill has treated 11,000 tons of gold ore, yielding $158,000 net.

Reno.—The fifth session of the Prospectors' Short Course, held annually at the Mackay School of Mines, University of Nevada, will open on January 6 and continue until February 1. The course offers an admirable opportunity for the mining man to brush-up his knowledge along the lines of prospecting, assaying, mineralogy, geology, etc. No charges are made for instruction in this course, although there is a $5 fee charged to cover the cost of supplies used. Text-books are not required, but certain texts are recommended, as it is usually difficult for members of the class to keep satisfactory notes. A certificate is issued on the satisfactory completion of the course.

Tonopah.—On January 1, Tonopah Extension pays a dividend of 5%, equal to $64,140.

Virginia City.—The Mexican Gold & Silver Mining Co. has levied an assessment (No. 110) of 10 cents per share.

NEW MEXICO

Nogal.—The Vera Cruz Leasing Co. has ordered $15,000 of machinery to increase its mill and cyanide plant capacity to 100 tons daily. A tunnel 675 ft. long has developed 60,000 tons of $8 gold ore. Costs are estimated at $4 per ton. Electric power is used. R. R. Foster of El Paso, Texas, is general manager.

Santa Rita.—Chino Copper pays $1 per share on December 31. This makes $4.50 for the year, against $9.90 in 1917. The November metal output was 6,464,285 lb., well up to the monthly average.

OKLAHOMA

Picher.—Production of Oklahoma fields last week totaled 3471 tons of blende and 837 tons of lead, valued at $237,295.

UTAH

Bingham.—On December 31, Bingham Mines pays a dividend of 50c. per share, making $2.50 for the year.

The Utah Apex Mining Co.'s report for the past year shows that ore sales, etc., realized $1,707,635. The net profit was $255,858. Litigation cost $68,138. The metal output was 6171 oz. gold, 644,551 oz. silver, and 42,811,805 lb. of lead.

The Utah Consolidated filed two suits last week against the Utah Apex to quiet title to the Yampa and two Mercer claims.

Utah Copper pays $2.50 per share on December 31. The total for 1918 is $10, against $14.50 in 1917. In November the mills produced 16,500,000 lb. of copper, the lowest since July.

Park City.—This district produced 9134 tons of ore and concentrate during November. The principal yields were: Ontario Silver, 2450 tons; Judge, 2220 tons; Silver King Coalition, 1775 tons; Daly West, 1440 tons; and Daly Mining, 672 tons.

Ontario Silver company pays 50c. per share, amounting to $75,000, on January 4.

Provo.—Grand Central pays 3c. per share on December 21. This amounts to $18,000, and makes $1,802,000 to date.

Silver City.—The Tintic Milling Co., treating ores from the Iron Blossom and Dragon Consolidated, recently shipped 63,368 lb. of bullion, containing $59,000 of silver, $11,000 of copper, and $300 of gold.

Tintic.—The district output in November was 649 carloads of ore and concentrate. There were 28 companies and lessees contributing to the output.

Tintic Standard, which shipped 76 carloads last month, paid 10c. per share on December 20. This is equal to $117,470, making $398,873 to date. A large body of ore has been blocked out at the 1300-ft. level.

CANADA

British Columbia

Grand Forks.—The Granby Consolidated company's smelter here, closed for a period because of lack of ore and coke, the result of the influenza epidemic, has resumed operations. Three furnaces now are in blast, and it is expected that there will be no further interruption, supplies being assured.

Ontario

Cobalt.—Nipissing pays a dividend of 10%, equal to $600,000, on January 20.

McKinley-Darragh-Savage company will pay a dividend of 3%, equal to $67,428, on January 1. The total to date is $5,402,023.

The Mining Corporation paid 18¾c. per share, equal to $311,259, on December 14. This makes a total of $5,906,097.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

J. E. Clennell is going to Chihuahua, Mexico.

Lewis P. Shakleford, of Juneau, Alaska, is visiting San Francisco.

George O. Bradley has returned to San Francisco from British Columbia.

Huntington Adams passed through San Francisco on his way to Antofagasta, Chile.

Peter P. Antipin, metallurgical engineer, of Kyshtim, Russia, is in San Francisco.

Horace V. Winchell passed through San Francisco on his return from Oatman, Arizona, to Minneapolis.

Leon Benett, captain in the French army, is visiting San Francisco in connection with mining business.

D. C. Jackling has returned to San Francisco from a tour of inspection to the copper mines under his direction.

Oscar F. Graff, formerly mining engineer at Kennecott, Alaska, now in the service of the Sulitelma Co., is living at Tolgen, Norway.

E. C. Voorheis attended the meeting of the Bureau of Mines at Washington on December 16 as a representative of the tungsten producers.

Edgar Rickard, by Executive Order of the President dated November 16, has been appointed to act as Food Administrator in the absence of Mr. Hoover in Europe.

W. L. Honnold is now in Paris on a special mission from the Guaranty Trust Co. of New York, but this does not affect his connection with the Anglo-American Corporation of South Africa.

Obituary

Howard W. Du Bois died on November 10 at Philadelphia, where he was born in 1868. He graduated from Lehigh University in 1892, and became partner with Charles T. Miner three years later. From 1896 to 1904 he was Professor of Applied Mathematics in the Central High School, at Philadelphia, but he spent his vacations in mining work, chiefly in Alaska and British Columbia. His illustrated lectures will be remembered with pleasure by many.

E. H. Wilson died at Warm Springs, Montana, on November 27, at the age of 67. A native of Louisiana, he graduated at Washington University, St. Louis, in 1870 and engaged at once in civil engineering, chiefly for railroad companies. In 1884 he joined John Gillie in engineering practice and they continued their partnership for 14 years. In 1898 he was retained by Heinze, and when that operator became inactive he returned to private practice. In 1891 he was president of the Montana Society of Mining Engineers. In 1899 he was a member of the State legislature.

Thomas G. Brown of Denver, Colorado, died at Lluvia de Oro, in Chihuahua, Mexico, on November 19 of pneumonia following influenza. He was 31 years of age and graduated from the Golden School of Mines in 1907. After graduation he spent some time in Colorado, being employed at the Tomboy and other mines. In 1910 he joined the staff of the Mines Company of America and was employed at both the Dolores mine, in Chihuahua, and the Creston-Colorada, in Sonora, for a number of years. In April 1917 he became assayer and chemist for the Lluvia de Oro Gold Mining Co., and in that capacity he was serving at the time of his death. His professional ability was of a high order and his personal qualities endeared him to a host of friends.—A. J. V.

THE METAL MARKET

METAL PRICES

San Francisco, December 17

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	10.00
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	7.30—7.80
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$110
Spelter, cents per pound	10.50
Zinc-dust, cents per pound	16.00

Antimony in stock at June 30, 1918, amounted to 2899 tons, against 3577 tons at the end of May and 4686 tons at the end of April. Imports of metal—January to August—were 7294 tons; in the whole of 1917 the total was 17,825 tons. Imports of ore in these periods were 2404 and 10,370 tons. Smelter production from domestic ores was 123 tons and from foreign ores 1707 tons, in the 8 months of 1918.

ORE PRICES

December 17

Chrome, no definite quotations available.	
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% MoS_2	$0.75—$1.00
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, per unit	$17—$23

EASTERN METAL MARKET

(By wire from New York)

December 17.—Copper is stagnant, 26 cents being the asking price. Lead is inactive and easy. Spelter is dull and easy.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, which have since been extended to January 1, 1919, prices to be effective on the day of shipment, not the day of sale. Quotations in cents per pound are as under:

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government fixed its maximum at 49½ pence, on September 2, but on November 12 this was changed to 48¾ pence, due to a drop in price.

The condition of the silver market in London is unaltered. Trade demand is hardly so active as it has been of late. Shanghai exchange is quoted 5s.1d. ($1.22) per tael. News concerning Indian crops is rather better, as the north-eastern monsoon is progressing favorably. Indian currency returns are as under in lacs of rupees (1 lac = $32,000):

	October 31	November 7	November 15
Notes in circulation	13,643	13,761	13,867
Reserve in silver coin and bullion	2,991	3,109	3,211
(within and without India)			
Gold coin and bullion in India	2,040	2,040	2,044
Gold coin and bullion out of India	12	12	12

The above figures show that the silver holdings, within and without India combined, continues to increase; this fact, however, is owing really to heavy purchases in America. For instance, of 2793 lacs, the total holding on October 7, 2207 were within India, while on November 15, of 3211 lacs only 1765 were so held. The stock in Shanghai on November consisted of 20,600,000 oz. in sycee and 11,200,000 dollars (50c. each), compared with about 22,550,000 oz. and 11,200,000 dollars on November 9.

LEAD

Lead is quoted in cents per pound, New York delivery. Early in July, producers agreed to fix prices at 8.05c. per lb., New York. This was reduced to 7.05c. on December 2.

Lead concentrate—80% metal—is now selling for $80 per ton at Joplin, Missouri. This is a drop of $20, due to the lower price of the metal.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

The zinc-ore market at Joplin, Missouri, was fairly strong last week. Second-grade concentrate, 60% zinc, averaged $48 per ton.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government was taking 40% of the United States quicksilver output, paying therefore $105 per flask, and will continue to pay this until contracts are completed. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

TIN

Prices in New York, in cents per pound. The monthly averages in 1918 are nominal. Under the new international agreement, the United States is to get 66% of the world's supply of tin. On December 3 the War Industries Board fixed the price to consumers and jobbers at 72½c. f.o.b. Chicago and Eastern points, and 71¼c. on the Pacific Coast.

Eastern Metal Market

New York, December 11.

The markets that have been under war control continue so regulated, with no definite information as to any change in policy.

Copper is under control until January 1 at least, with conditions unchanged.

The tin market is not active, but is steadier as a result of the clearing-up of the control situation.

The lead market is lifeless, with re-sale metal reported as offered under the agreed price.

The zinc market has turned quiet, but is steady.

Antimony is inactive and unchanged.

At a meeting of steel manufacturers in New York, December 9, the general committee reported quite unexpectedly in favor of a 'moderate' reduction in prices in pig-iron and all rolling-mill products effective January 1. This was endorsed by a practically unanimous vote, putting the matter in the committee's hands with power. This committee is in conference with the War Industries Board today at Washington, and an announcement is looked for revealing lower prices throughout the list except iron ore. It is reported that pig-iron will be reduced $3, plates and shapes $5, and sheets and tin-plate $10 per ton. While the Board has indicated that there will be no Government prices on iron and steel after December 31, it may announce the new schedule as prices which manufacturers will seek to maintain as a fair readjustment from the war level.

COPPER

The copper market, as a market, is dead. There is no demand and no initiative. Consumers are merely waiting developments. Producers are not selling any metal except for delivery in December, and then only at 26c. with very little moving. Nothing will be done and nothing known about the market's future until some decision is made regarding conditions that are to rule after January 1. It is expected that a conference this week or the next will settle the matter. Whether a controlled or an open market will prevail depends on the attitude of the War Industries Board. Many expect either an open market or a lower controlled price. It can be stated authoritatively that the Government is taking all the metal it contracted for. No confirmation of any sales of electrolytic or Lake copper under the fixed price of 26c. is obtainable, nor is such likely the case. Casting copper continues to sell around 23c. per lb. A sale of 10,000,000 lb. to the Italian government at 26c. is not confirmed. We quote the market at 26c., the fixed price, which is effective until January 1. John D. Ryan has been elected as the chairman of the board of directors of the Anaconda Copper Mining Co. and president of the United Metals Selling Company.

TIN

The announcement last week of a decision as to the handling of the importations of tin, the price at which it is to be allotted to consumers has relieved the situation, and also somewhat steadied what little market there was, that in re-sale metal. This had sold down in small lots to 70c., New York, but is now quotable at 72c., New York, at which level a few sales have been made. Some re-sale lots have been withdrawn and there is a little better demand. The general situation, however, is very mixed and some interesting, perhaps sensational, developments are possible. It is an interesting fact that the United States Steel Products Co. now has allocated to it 10,000 to 12,000 tons of tin, only part of which has arrived, and also that a conservative estimate places the stock in consumers' hands who have over-bought at 20,000 tons, or both together equal to a six months' supply. As announced last week the fixed price of tin allocated to and imported by the U. S. Steel Products Co. is 72.50c. per lb., New York and Chicago, and 71.25c., Pacific ports, with the 'outside' market now 72c., the latter referring to such Banca and Straits tin as is available for re-sale. An interesting report is that the Tin Importers' Association is "to make a strong protest against the import without restriction of Bolivian concentrate for smelting into tin here, and the delay thereby caused in the liquidation of the supplies of the U. S. Steel Products Co. At present prices it is estimated a profit will accrue to the American smelters of about 14 to 15c. per lb., and that their output will be around 1500 tons per month, or one-third of the probable entire United States consumption in the next few months." The London market is £270 per ton for futures. Arrivals so far in December have been 450 tons at Pacific ports and 30 tons at Atlantic.

LEAD

The recent reduction in the agreed maximum price on lead has not stimulated buying, and the market is lifeless. Quotations continue at 6.75c., St. Louis, or 7.05c., New York, with no sales reported. Rumors are to the effect that re-sale metal has appeared and even sold at 6.75c., New York, but this has not be verified. The War Trade Board has removed pig-lead from the export conservation list. The general situation is still in the control of the Lead Producers' Committee; how long it will remain so is problematical.

ZINC

The market has quieted down considerably after a week or 10 days of fairly liberal buying of prime Western by galvanizers and for export. Much of this has been for delivery in the first quarter. For early or December delivery the quotation is 8.25c., St. Louis, or 8.60c., New York, for prime Western, with prompt metal scarce. For the first quarter the quotation is 8c., St. Louis, or 8.35c., New York. The Government weekly report of stocks and output for the week ended November 30 shows little change, the increase in each case not being large.

ANTIMONY

The market is dull and unchanged at 8.50 to 8.75c., New York, duty paid for wholesale lots for prompt and early delivery.

ALUMINUM

Government prices still control the market for No. 1 virgin metal and for scrap metal at 33c. per lb. for 50-ton lots, 33.10c. per lb. for 15 to 50-ton lots, and at 33.20c. per lb. for 1 to 15-ton lots. The metal is now practically free for domestic consumption.

ORES

Manganese Alloys: The market for both ferro and spiegel is dead. The former is obtainable at $240, delivered, as re-sale alloy, while most any analysis of spiegel can be bought at $70, furnace.

Molybdenum: The market is nominal at 75c. to $1 per lb. of 90% concentrate.

Tungsten: The market is at a standstill, and there has been no effort to test it. Your correspondent was told on the 10th that there is about 3000 tons of concentrate in and around New York bought at recent high levels, with holders very nervous as to the future. The committee of tungsten men has laid the situation before the U. S. Bureau of Mines and the War Trade Board, and it is stated considerable 'sympathy' was expressed for them.

Book Reviews

The Mineral Industry for 1917. Volume XXVI. Edited by G. A. Roush and Allison Butts. Pp. 928, ill., index. McGraw-Hill Book Co., New York, 1918. For sale by 'Mining and Scientific Press'. Price, $10.

Many difficulties prevented this annual reference from publication before the last month of the year following that to which the work refers, yet it is unfortunate that it cannot be issued by August at the latest. Probably now that the War is over an effort for early publication will be made. Apart from this condition, 'The Mineral Industry' is as valuable as heretofore, and should be on the shelves of those who have to keep in touch with the statistics, technology, and trade of the world's metals and minerals. The United States, on account of trouble in foreign countries, is given most of the space, which, by the way, is only 11 pages less than in the previous volume. The 42 contributors are all well known specialists; a few changes are noticeable in the list for this issue. As usual, copper, iron, lead, and zinc are given considerable attention; but miners and metallurgists in the West will find plenty of interest in the chapters on antimony, borax, chromium, fluorspar, gold and silver, graphite, megnesite, manganese, molybdenum, potassium and sodium salts, pyrite, and tungsten. Progress in ore dressing occupies 63 pages, bringing out the points of discussion and new machines for the year. Eighty pages of statistics—necessarily not complete for foreign countries—completes a valuable compendium.

The Occurrence, Chemistry, Metallurgy, and Uses of Tungsten. With special reference to the Black Hills of South Dakota. By J. J. Runner and M. L. Hartmann. Bulletin No. 12 of South Dakota School of Mines, Rapid City, 1918. Pp. 264, ill., index. Obtainable by writing to the above address.

With this valuable treatise, that of F. L. Hess of the U. S. Geological Survey, and that of Herman Fleck of the Colorado Scientific Society, the tungsten producer, maker of ferro-tungsten, chemist, student, and prospector, should be fully equipped for a study of this important mineral. The South Dakota School of Mines has been particularly active in tungsten investigations, naturally enough, as the Black Hills has some good deposits of wolframite. This "paper" (so called in the preface) covers the whole subject in detail. In the chapter on the geologic occurrence of tungsten we find the types discussed under segregation deposits, pegmatites, veins, replacement deposits, contact metamorphic deposits, and placers. Enough data has not been secured in any country to determine the persistence of tungsten at depth. The Black Hills deposits are fully discussed, with figures of production and notes on dressing the ore. The chemistry, metallurgy, and uses of tungsten are thoroughly described, including the manufacture of ferro-tungsten. Laboratory tests include qualitative, quantitative, and specific gravity methods. The bibliography of 95 pages, by Mr. Hartmann, must have entailed great research, and in it one can find everything written on tungsten.

The Adirondack Graphite Deposits. By Harold L. Alling. Pp. 150, ill., maps, index. Bulletin 199 of New York State Museum, University of the State of New York, Albany, 1918. Obtainable by writing to the above address.

Judging by the enquiries received by the 'Press', an increasing number of people are becoming interested in graphite. New deposits are being developed in this country, and new literature on the subject is needed. In this treatise will be found not a dry dissertation on the specified deposits of the Adirondack country, but the work of producing companies, concentration of ore, and problems therein, prices, and other interesting points. Those interested in graphite will gain by securing a copy of this bulletin.

Modern Shipbuilding Terms. By F. Forrest Peace. Pp. 143, ill. J. B. Lippincott Co., Philadelphia. For sale by 'Mining and Scientific Press'. Price, $2.

This is one of the best among the books that have been published recently to meet the need for information regarding shipbuilding. The author is an instructor in the training section of the Emergency Fleet Corporation. About 2000 terms are defined in non-technical language. The appendices contain discussion of electric, oxy-acetylene, and oxy-hydrogen welding with illustrations showing the various types of welds, a description of the Isherwood system, and a bibliography. There are about 70 plates illustrating many of the terms defined.

Hydraulic Experiments with Valves, Orifices, Hose, Nozzles, and Orifice Buckets. By A. N. Talbot, F. B. Seely, V. R. Fleming, and M. L. Enger. Pp. 76, illustrated. Bulletin No. 105 of University of Illinois Experiment Station, Urbana, Illinois. Obtainable by sending 35 cents to the above address.

Hydraulic and hydro-electric engineers and others will find in this a useful lot of tests and conclusions. The free flow and efficient use of water is of great importance.

Company Reports

SANTA GERTRUDIS COMPANY, LIMITED

Property: mines and mills in Pachuca district, Hidalgo, Mexico.

Operating Officials: Hugh Rose, general manager; C. A. Lantz, general supervision; T. C. Baker, mine superintendent; W. E. Crawford, mill superintendent; F. H. Walsh, mechanical and electrical engineer; D. F. Moss, accountant; W. J. Cox, advisory engineer.

Financial Statement: the profit for the year ended June 30, 1918, was £112,544 ($537,000), plus £21,329 ($101,000) brought forward, a total of $638,000. After paying dividends there was a balance of £1498 ($7200).

Dividends: two, totaling £131,250 ($628,000) were paid.

Development: labor was plentiful and mining supplies were readily obtainable. Work was considerably hampered during the second and third quarters of the year owing to loss of a shipment of dynamite; also to the diversion of compressed air to the operation of pumps in the recovery of the flooded 20th level. Exploration covered 7014 ft. Of this, 2608 ft. was in payable ore, 2590 ft. in vein below pay, and 1816 ft. in rock. There was pumped from the mine an average of 748 g.p.m. The rate of ore extraction was 80.7% of normal capacity. Reserves are estimated at 880,433 tons, containing 53,987 oz. of gold and 9,595,000 oz. of silver, this being the recoverable metal.

A 20 years' working agreement was arranged with El Bordo, Malinche, El Cristo, and La Zorra properties of 431 acres in the Pachuca district. The first named is estimated to contain 253,000 tons of ore, which should yield a profit of $2,142,000. The mine is on the Viscaina vein, one of the largest in this district. In about 12 months El Bordo should produce 500 tons of ore daily. The Malinche has splendid possibilities.

Production: the new mill worked at 80.7% capacity, partly due to shortage of cyanide and partly on account of trouble in settling and filtering. There was treated 324,-

762 dry tons of $14.06 ore, of which 87.95% was extracted. The ore contained 21,856 oz. of gold and 3,775,745 oz. of silver .

Flotation tests showed that the process in its present stage is unable to compete commercially with cyanidation. The plant will be enlarged by a ball-mill, tanks from the idle Guadalupe mill, and another filter-press. Aluminum dust is used in place of zinc dust as a precipitant.

CAMP BIRD, LIMITED

Property: gold mine and mill in Ouray district, Colorado.

Operating Officials: W. J. Cox, general manager; T. H. Woods, mine superintendent.

Financial Statement: the company derived no revenue from mining operations, but received £67,394 ($321,000) from the Santa Gertrudis company in Mexico. The profit for the year ended June 30, 1918, totaled £74,745 ($374,000). After paying two preference dividends, amounting to £45,474 ($216,000), the balance for the current year is £29,272 ($158,000). Assets, including £1,032,801 in Santa Gertrudis shares at par value, total £1,080,466 ($4,380,000). Cash amounts to £112,052 ($537,000).

Development: the Camp Bird vein was encountered in the tunnel on June 1, 11,000 ft. from the portal (compared with the estimated distance of 10,700 ft.), and vertically under the third-level adit, approximately 1450 ft. The vein in appearance is characteristic of exposures of barren vein in the upper levels, which includes strike, dip, and many features peculiar to this vein. A 77-ft. drift to the west was made, disclosing an increasing width of vein until at the face it is 8 ft. between walls, half of which is quartz, carrying sulphide, including spots of galena. To the east from the tunnel intersection the vein is not so plainly defined, and a turn to the north combines to make it more difficult to follow. Including an absence of gold-silver content, vein structure at this horizon compares favorably with this section in the third level. The tunnel now becomes the east-west dividing line of workings on the vein. That to the east is designated 'tunnel level east', and that to the west 'tunnel level west'. It is of first importance to obtain natural ventilation for this two-mile tunnel. This will be obtained by driving east on the Camp Bird vein to a projection of No. 3 shaft, and then by raise connecting with the ninth level, estimated to be accomplished in January 1919. Meanwhile the level west will not be advanced.

TOMBOY GOLD MINES CO., LIMITED

Property: mines and mill in the Telluride district, Colorado.

Operating Officials: D. A. Herron, general manager; J. S. Peterson, assistant; W. K. Betty, consulting metallurgist; P. L. Foster and R. M. Raymond, consulting engineers.

Financial Statement: the revenue for the year ended June 30, 1918, was £239,449 ($1,150,000). Expenses totaled £182,084 ($864,000), leaving a profit of $286,000. After paying dividends there was carried forward £35,168 ($168,000), compared with £30,726 ($144,000) brought forward from 1916-'17. Current assets total £85,016 ($408,000), and liabilities £30,106 ($144,000).

Dividends: two, amounting to £23,250 ($110,000) were distributed.

Development: in the Argentine mine, 568 ft. of work was done on the east faces of the 1900 and 2100-ft. levels. In 359 ft. of the upper level, 5 ft. of ore averaged $3.62 in gold and silver, 4.45% lead, 6.89% zinc, and 0.8% copper. At 2100 ft. depth, 111 ft. driven on 4.2 ft. of ore assayed $2.83 in precious metals, 2.13% lead, 4.42% zinc, and 0.95% copper. Reserves are 130,000 tons, of which 100,000 tons are broken in stopes.

In the Montana mine, exploration covered only 3346 ft., much lower than usual due to the labor supply. About 1500 ft. of this was done on the Virginius vein, 400 ft. being through the Robson claim of the Camp Bird company. Within the Tomboy boundaries, this body is 900 ft. long, assaying $9 in gold and silver, across 3 ft. Other workings show $15 across 6 ft., and $12 silver and 5.9% lead over 4 ft. Reserves are estimated at 350,000 tons, exclusive of the Sidney and Virginius. Of this, 200,000 tons are broken.

Production: the mill concentrated 151,028 tons of ore, and the cyanide plant 129,089 tons of tailing, yielding amalgam worth $306,003, concentrate worth $661,683, and cyanide bullion worth $166,569. With sundries, the total revenue was $1,131,267. Costs were $5.58 per ton.

Experiments made on Tomboy ores by flotation give hope of solving the problem of their treatment in the near future.

McINTYRE PORCUPINE MINES, LIMITED

Property: gold mines and mill near Porcupine, Ontario.

Operating Official: R. J. Ennis, general manager.

Financial Statement: the revenue during the year ended June 30, 1918, totaled $1,714,258. Operations, administration, and sundry adjustments, left a profit of $811,572. After deducting $131,211 for depreciation, the net profit was $680,361. With the surplus from 1916-'17 there was available $1,413,715. Current assets amount to $393,679, and liabilities $106,181. Investments at cost are $104,117, and depreciation and general reserves $532,207.

Dividends: three of 5% each, amounting to $541,542, were paid.

Development: there was 6893 ft. of work done, also 6987 ft. of diamond-drilling, making 51,544 and 26,907 ft., respectively, to date. The shortage of men—a falling-off from 380 to 295—made it impossible to do the exploration planned. Ore-reserves to a depth of 1000 ft. are estimated as 459,276 tons, averaging $9.80 per ton. Electric hoists of 2000 ft. capacity were placed at No. 5 and 1 shafts of the Jupiter. An electric storage-battery was installed during the period.

Production: The mill treated 178,327 tons of $9.30 ore, extracting 95.6%. The total since 1912 is $611,525 tons of $9.28 ore. Costs totaled $5.1466 per ton. A set of 60 by 30-in. rolls was added to the crushing-plant, the main shaft to follow the 7½ gyratory crusher, and reduce the ore suitable for the ball-mills in the cyanide mill.

KERR LAKE MINES, LTD.

Property: silver mine at Cobalt, Ontario.

Operating Official: H. A. Kee, mine manager.

Financial Statement: during the year ended August 31, 1918, sales of ore and metal, plus interest, realized $2,394,219. Operations cost $721,902, leaving a profit of $1,672,317. Assets total $3,076,001, of which $2,040,840 consists of Canadian and American bonds, $325,252 cash, and $549,336 ore in transit.

Dividends: these amounted to $650,000, making $7,710,000 to date.

Development: the total footage was 3089, practically the same as in 1916. No new veins of importance were found, but extensions of the known ore-shoots carried milling ore. Reserves are estimated as 34,730 tons of milling ore containing 639,800 oz., and high-grade ore with 997,500 oz., a total of 1,637,300 oz. Mining cost $5.11 per ton.

Production: 19 veins contributed to the output of 2,038,287 oz. There was 1017 tons of ore sacked for shipment, and the mill treated 27,835 tons assaying 21.09 oz. per ton. In 1916 this averaged 26.26 oz. The sliver content of all products totaled 2,582,993 ounces.

Costs: on a per ounce basis were 9.60c. for underground work, 14.20c. for shipping and treatment, and 0.94c. for general charges, a total of 24.74c. per ounce.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

20-YARD DUMP-CARS IN OPEN-CUT MINING

Steam-shovels and dump-cars are the two most notable results of the development of excavating machinery. The 360-ton revolving-shovels, with their 7 and 8-yd. dippers, were manufactured to meet the demands of stripping coal. Subsequently they were introduced to the Lake Superior iron ranges, with great success.

Development of the side dump-car from the original yard and half-yard sizes to that known as the Western 20-yard automatic compression-lock air dump-car, has been due largely to the increasing demands on the Mesabi iron range, where excavation of ore and overburden reaches the enormous total of 30,000,000 cu. yd. each year. In fact, the U. S. Steel Corporation, which is the largest operator on the range, is partly responsible for the compression-lock car. Fifteen tons of material is lifted every minute and dropped from a height of 7 to 8 ft. into the dump-cars, which become broken under the impact. Nearly three years ago the Corporation's engineers bought ten 20-yd. cars, each of five different makes, and started in to 'break them up' and during many months they were subjected to the hardest kind of stripping service. Out of that rigid test was developed the Western 20-yd. car, manufactured by the Western Wheeled Scraper Co. of Aurora, Illinois. This type was installed on the range in large numbers.

A WESTERN DUMP-CAR

WESTERN DUMP-CAR DISCHARGING

The features that are individual to this car, aside from the well known standard Western mechanical design, are the means of unlocking, locking, and controlling the position of the bed, without the use of side-chains or any fixed connection between bed and underframe. The car is so designed that the shock from the heavy dipper-load—15 tons dropped from a height of 7 ft.—is carried through the truck-springs to the roadbed.

So successful were these cars on the iron range that they have since been installed in the copper districts, where they are used both for stripping and hauling low-grade ore to the concentrating mills. The Copper Queen last year put in a large number of these cars at Bisbee, Arizona, to work at its Sacramento Hill deposit. The United Verde Copper Co. is now using similar cars at Jerome.

The fact that steam-shovel mining can be carried on where conditions are right for half the cost of underground mining makes the question of stripping

STEAM-SHOVEL AND WESTERN DUMP-CARS AT SACRAMENTO HILL MINE OF COPPER QUEEN CO., BISBEE, ARIZ.

one of growing importance, and the development of an air dump-car is an essential factor. In the final analysis, successful steam-shovel operation, whether in ore or stripping, is a transportation problem, pure and simple.

UNDERGROUND MINING WITH ELECTRIC-SHOVELS

Electric-shovels are becoming increasingly desirable in underground mining. For years many of them have been used in iron, coal, zinc, limestone, and salt mines. Their performance has definitely established them as highly economical factors in this class of excavation.

The accompanying chart shows the power consumed by

A THEW ELECTRIC-SHOVEL IN A NEW YORK IRON MINE

one of these shovels in a New York iron mine. The half-tone illustrates a Thew electric-shovel, built by the Thew Automatic Shovel Co., Lorain, Ohio, mining iron ore in New York. It is equipped with a 20-hp. motor, and the record is during the loading of 5 consecutive cars of ore. For car No. 1 it was 16.04 hp.; for No. 2, 20.75 hp.; for No. 3, 16.25 hp.; for No. 4, 17 hp.; and for No. 5, 14.25 hp., or an average of 16.86 hp. for the five.

During the last four months of 1917 and the first five months of 1918, a total of 37,268 tons of ore handled by an electric-shovel was $4824 for labor, $1225 for supplies, and $122 for power, a total of $6171. The average cost per ton was 16.6 cents. These costs cover all the expense involved in actually loading the ore and tramming it 300 ft. to the main haulage-way. They include, also, the expense of moving the shovel to different levels and places. The ore was loaded into 3-ton gable-bottom cars.

Under identical conditions the per-ton loading cost by hand-labor was 30 cents, and by shovel 16.6 cents. The saving effected by the shovel was 13.4 cents per ton, or $5000 in nine months.

A North-Western iron company has used a similar electric-shovel for 4½ years. The ore was 25% fine and 75% lumps, the largest pieces being 24 by 24 by 18 in. This shovel loads from 150 to 220 tons daily. The following table gives the tonnage and the average cost per ton, for each financial year, ended June 30, from 1914 to May 1, 1918:

	Electric-shovel		Hand operation		
Year	Tonnage	Cost	Tonnage	Cost	Saving
1914	20,820	$0.268	102,438	$0.466	$0.20
1915	24,497	0.253	34,222	0.324	0.07
1916	32,261	0.304	84,485	0.318	0.01
1917	31,530	0.344	77,653	0.391	0 05
To May 1, 1918..	26,430	0.408	59,646	0.510	0 10

In a Western zinc mine a mining shovel loaded 125 cars in 5¾ hours at a cost of less than 9 cents per ton, including tramming. This represented a reduction in cost of handling material and hauling it to the shaft for hoisting to the surface from 16 and 18 cents per ton by hand to 9 cents by the shovel, a direct saving of 45 to 50%. Five of these shovels are now working in that mine.

The construction of this underground mining shovel is novel, embodying a somewhat radical variation of the standard, full-circle, swing-type steam-shovel.

The motor is of the single, constant-speed type, with friction controls. All electric equipment and connections are simple. Hoisting, crowding, swinging, and propelling movements are all controlled direct from this motor, minimizing physical efforts by the operator and enabling him to easily increase capacity.

In Bulletin PM-42, the **Worthington Pump & Machinery Corporation** describes the 'Superior' crushing-rolls made by the **Power & Mining Machinery Works** of Cudahy, Wisconsin. These machines are manufactured with rolls from 24 to 54 in. diameter, taking a maximum feed of 1 to 2 to 2½ to 4½ in., depending on whether the shells are smooth or corrugated. Some special features have been incorporated in the design of these rolls. A useful discussion on horsepower is included, also notes on the 'simplex' rolls, feeders for rolls, and sectional rolls.

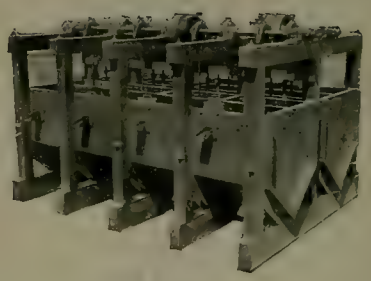
Richards Pulsator Jig

THESE figures illustrate the difference in size between two units of equal capacity.

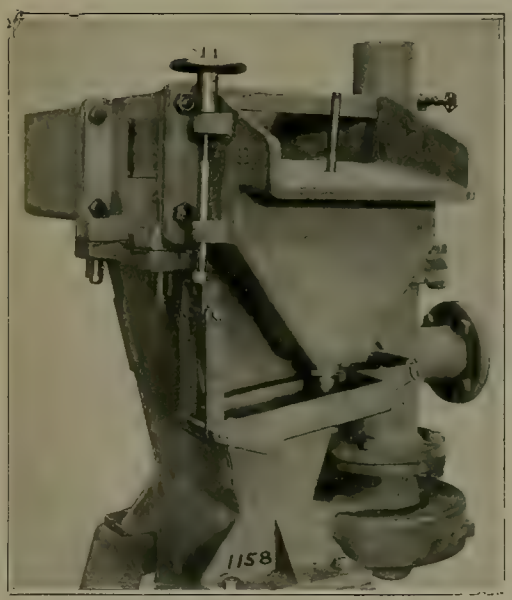


Plunger Type Jig

"TEETERING"

is the name Dr. Richards applies to the action of a Richards Pulsator Jig. A peculiar form of *pulsating* water current, as compared with the rising and falling of the bed in the plunger type of jig makes the difference.

There is no suction stroke—therefore, no clogging—in the



Richards Pulsator Jig

The impulse of the water is always *upwards through* the screen. The particles are repeatedly forced away from—not towards—the screen, thereby keeping it always open, and saving the fine material.

With less power, screen surface, maintenance, and space, this Jig will do everything an ordinary jig can do—faster and better.

NOTES 845

BOUNDARIES: RACIAL AND NATURAL 847
The basis for readjusting new frontiers in Europe. The interpenetration of races and languages. Poland, Alsace, Belgium, and Rumania. Need for compromise and a willingness to make the best of complex conditions. M. & S. P., December 28, 1918.

THE UTAH COPPER ENTERPRISE 848
A retrospect of the series of articles appearing on this subject. The tonnage, cost, and profit in 11 years. Enormous dividends and remarkable consummation of the plan of operation devised at the beginning of this undertaking. The men to whom credit is chiefly due. M. & S. P., December 28, 1918.

DISCUSSION

THE MARKET FOR SILVER
By M. T. Chestnut, Jr. 849
The resumption of exports and the probably insufficient supply. India as a sink for silver. The extremely favorable outlook for the silver miner. M. & S. P., December 28, 1918.

PLATINUM IN BRITISH COLUMBIA
By C. Roy Price 850
One who has spent his money and time searching for platinum on Olivine mountain. A warning to the public. M. & S. P., December 28, 1918.

CONDITIONS IN RUSSIA
By C. L. F. 851
A letter from an American mining engineer just arrived from Siberia. The need for an Allied police force. M. & S. P., December 28, 1918.

THE FUTURE OF MANGANESE
By F. F. S. 851
A criticism of Mr. Blakemore's letter. Why there is no tariff on manganese ore. M. & S. P., December 28, 1918.

THE CHROME SCANDAL
By Justice F. Grugan 851
The experience of a chrome producer who was persuaded by Government propaganda to engage in this branch of mining. A plea for remedial action. M. & S. P., December 28, 1918.

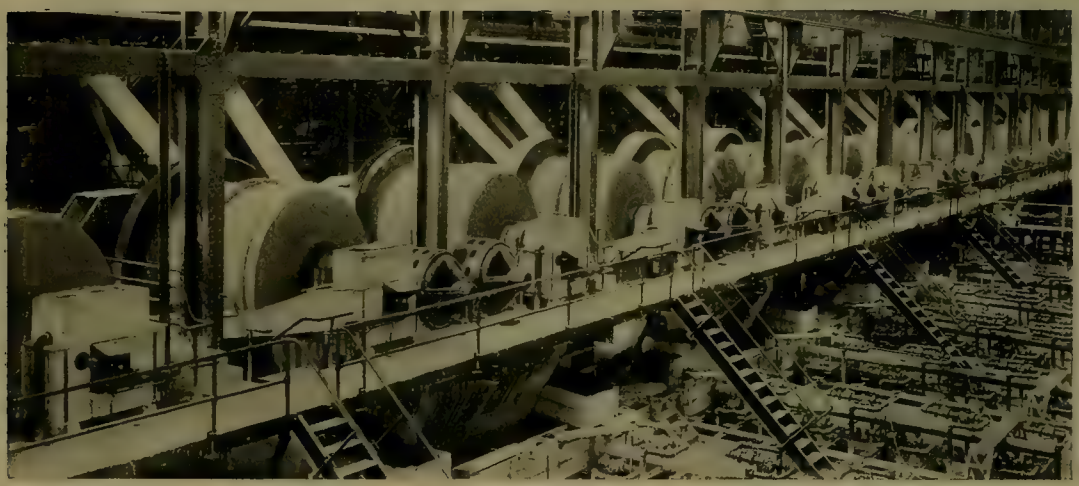
ONE-EASY-STEP



Largest Ball Milling Plant in the World

¶ In most concentrating plants, ore-production is the *big* item of cost.

¶ Here the greatest amount of labor is required and labor today is of course "sky high."

¶ Furthermore, it gets harder and harder to get skilled labor.

¶ With unskilled labor simplicity is essential; which is one reason why Marcy Mills are being generally adopted by successful companies.

¶ The annual reports of various mining companies show that the Inspiration Consolidated Copper is one of the biggest low cost copper producers. "One Easy Step" is the system they use.

NO assessment work on mining claims is required on account of 1918.

ESTIMATES made by the U. S. Geological Survey show that the value of the mineral production of this country in 1917, under the spur of war, reached the unprecedented value of $5,010,948,000, exceeding by 43% the previous high record of 1916. Undoubtedly the total for the current year will be even higher. Such figures demonstrate the extraordinary growth of our domestic mining industry.

IN this issue we publish excerpts from a pamphlet on 'The Value of Gold in Our Economic System' written by Mr. Henry Strakosch, the managing director of the Union Corporation, formerly A. Goerz & Co., of London, controlling an important group of mines on the Rand. Mr. Strakosch deals with the subject from the British standpoint, but much that he says is pertinent to the American discussion of the subject.

UNDER the head of 'Discussion' there appears a letter describing conditions in Russia and suggesting that the only practical remedy is the sending of an Allied military force large enough to guard the main lines of transport, so that provisions can be distributed and the people given a chance to resume their normal occupations. Our correspondent has just arrived from Siberia and was recently in Petrograd itself, so that he writes at first-hand. Russia, like the countries of Central Europe, is in need of order, then food, then clothes. The first test of government is the enforcement of order, without which man reverts to his jungle existence and savagery becomes rampant. The Allies, we hope, will co-operate in sending a force of at least 250,000 soldiers to Russia to rescue her from Bolshevist chaos.

RUMORS of good ore having been struck in the old Camp Bird mine, in Colorado, are confirmed by a telegram given out by the company in London, stating that for a stretch of 20 feet and a width of 12 inches samples assay 2 to 3 ounces of gold and 10 to 20 ounces of silver per ton. This ore has been cut in an inclined raise from the new adit to the old workings, so that the exact relation of it to the deeper development of the mine is uncertain. The news stimulated buying of the stock, the quotation for which rose from a little under $1 to $4.25 per share. It takes more than a swallow to make a summer, and more than two swallows to make a drink; likewise twenty feet of two-ounce ore will not make a new mine of the old bonanza at Ouray, but we rejoice at this indication of possibly renewed productivity. The experience of the district and the geologic data are distinctly unfavorable, in our opinion, to the expectation of an ore-bearing horizon in the approach from the andesitic breccia to the sedimentaries, but there may be scope above the lower horizon for the distribution of valuable orebodies. We hope that the expectation of the management will be richly realized.

EVIDENCE is forthcoming to show a revival of interest in mining speculation. Among other signs of the times we note the purring of the wild-cat. We regret that so good a paper as the 'Salt Lake Tribune' should print such a flagrantly irresponsible prospectus as that of the Colorado Pitchblende Company. In this advertisement it is stated that experts testify "without batting an eye" that the mines of this company contain "twenty million tons of ore worth $85 per ton, practically in sight. This means, in round numbers, one billion seven hundred million dollars." The company is said to be capitalized "for only $100,000, divided into 2,000,000 shares." Then comes the remark: "Figure from that, if you dare, what shares in this company will eventually be worth." We dare to make an estimate, and it is very low. Among the experts mentioned by name is "a special writer for the 'Denver Post'," a paper that exemplifies the utter prostitution of journalism; the other professors and doctors mentioned we do not know, but if they endorse the statement of a "reputed specialist" that "the Colorado Pitchblende Company has $900,000,000 worth of profits to realize on", then the more we think of them the less we think of them. Any lingering doubt as to the meretricious character of this enterprise would be removed by other assertions appearing in the prospectus; for example: "The venture is practically without hazard. The ore is right on the surface—actually discernible with the naked eye." It should be noted that the valuable metal that makes it 'ore' is 0.1% of uranium, so that its discernibility to "the naked eye"

presupposes a radio-active vision. One of the directors is a wool-grower; that may explain the effort to pull wool over the eyes of the simpletons to whom only such an invitation would appeal. The 5-cent shares are offered at $2; "every $500 should earn $100,000." In the light of experience, we think this unlikely.

AT the meeting of representatives of mining convened by the American Mining Congress on December 16 and 17, at Washington, a committee was appointed to interview the Secretary of the Interior. He stated that the War Minerals Act was capable of being used [to rectify the wrong done to the producers of chrome], but on account of probable criticism upon the necessary expense he would not avail himself of the Act unless directed to do so by Congress. He favored action to make the Act "applicable for liquidating losses." The convention appointed a permanent executive committee, which includes Mr. Courtenay De Kalb, who went to Washington in the interest of the Chrome Producers' Association. This committee has prepared a congressional resolution, in drafting which the co-operation of Secretary Lane and the Mining Committee of the American Mining Congress was obtained. Immediate consideration is deemed probable. The embargo on imports cannot apply any longer than 30 days more without congressional action.

RECENT official announcements of German and Russian casualties in the War should be taken with a liberal pinch of sodium chloride. The statement from Berlin that only 659,000 German soldiers were killed is a manifest lie, for it would involve the supposition that this number of Germans fell during the fighting in which two million British and French sacrificed their lives, not to mention at least another million of Russians, Italians, Servians, Montenegrins, and Rumanians that fought and fell before the German contingents on the various eastern battlefields. We are asked to believe that fully 4,000,000 of the Allied soldiers had to die in order to kill 659,000 Germans! If that be so, then Germany's debit in the great accounting is just so much the heavier than her bitterest enemy could have supposed. We do not believe the Berlin statistics, recognizing the attempt to soothe the German people into the belief that their losses were relatively small. In days to come the Germans undoubtedly will say that their armies were not defeated but that they had to capitulate on account of lack of food and political disorganization at home. In regard to the Russion estimates of losses in battle, they are stated by the Director of the Russian Information Bureau—a sort of George Creel, we presume—to be 8,000,000 in total casualties, of which 3,000,000 were killed and 1,000,000 disabled for life. We do not believe it. With the published statement of this Information Bureau goes a plea for sympathy because "Russia has sacrificed millions of her sons and all her happiness to make the triumph of the Allied cause possible." That supplies the motive for exaggeration, namely the desire to impress the Allies with the greatness of their debt to Russia. None will refuse to recognize this debt, but it should not be impressed upon us by statistical lies. The two sets of figures, from Berlin and Petrograd, respectively, are vitiated by the evident intention to use them as propaganda.

VARIOUS suggestions are being made as to the amount of money Germany should be made to pay in reparation and restitution. It is well to know what are her financial resources. Before the War the federal revenue of Germany was about 850 million dollars, of which nearly 500 millions was spent on the army and navy. This revenue, however, did not include the revenues of the individual States, and personal taxation was comparatively light. It is estimated that Germany's financial capacity is equal to meeting a fresh debt of about 25 billion dollars involving an annual charge, for interest and sinking fund, of 6%, or 1500 million dollars. Obviously much of the talk of compelling Germany to pay the entire cost of the War to the several belligerents is made without regard to these facts, quite apart from the doubt as to the fairness of imposing a condition apparently not contemplated during the exchange of ideas before the armistice was signed. By the time Germany has been compelled justly to make reparation for the damage, looting, and theft to which the civilian populations of Belgium and northern France were subjected, and has been made to pay for the mercantile marine she sank illegally, she will have a burden big enough to remind at least one generation of Germans that it is unprofitable and unwise to attempt the subjugation of a world in which Frenchmen, Britons, and Americans claim the right to live in their own way.

ON November 1, 1918, the British Metals Corporation was registered with an authorized capital of $25,000,000, of which $10,000,000 has been subscribed privately by "important metal and financial interests." So says the 'Financial Times'. No public issue of shares is to be made. The board of directors is powerful, it includes representatives of the Hudson's Bay Company, the Rio Tinto Copper Company, the Consolidated Gold Fields of South Africa, and Vivian Younger & Bond, the last named being an important firm of metal-dealers. The articles of association provide that the British Treasury shall have the right at all times to be represented on the board by one director, not to be removable except by the Treasury. An official statement explains, among other things, that the principal objects of the company are "to regain and retain for British interests the predominance in the non-ferrous metal trades of the Empire usurped in recent years by German organizations. . . . To support and sustain the general trade of the United Kingdom in non-ferrous metals, and especially to maintain the position hitherto occupied by the market in London. . . . To develop and extend mineral and metal production of the Empire, and to promote the well-being of every interest concerned in the trade." Not much can be done toward carrying out this program

so long as the present restrictions on trading in metals remain in force, but an organization is being created, we are informed, to enable the corporation to assist at once in the rehabilitation of the metal markets. The 'Times', of London, states that the question of reorganizing the metal trade was broached at the Paris Conference in 1916 and that French and Belgian interests made a proposal for inter-Allied action, this proposal being received with such favor that it was decided to establish geographic units, with inter-Allied connections, for the purpose of supporting the metal interests of the Allies as against German monopoly. All this should prove interesting to American producers and sellers of the nonferrous metals because it is bound to have its effect, for instance, on the New York market. Such a combination as the British Metals Corporation may serve patriotic and otherwise useful functions, not only as against German monopolists, but against any system of unfair dealings. There can be no objection to it if it fulfills its avowed purpose "to promote the well-being of every interest concerned in the trade." If it does that it will differentiate itself from the German cartels. In matters of this kind we have an eye always to the possible jumping from the frying-pan into the fire, because a trust or a monopoly in the metal trade either at New York or at London is no better than one established at Frankfort or at Rotterdam. No patriotic veneer suffices to mitigate the ugliness of a cinch.

WE note that the big copper producers propose to co-operate, under the Webb Act, for the purpose of regulating the export of copper. This will serve also as a means for coming together for the purpose of a combination to control the production and domestic sale of their metallic products. The producers of tungsten, we understand, intend to take similar action under the Webb Act, which legalizes combinations for the purpose of regulating the export trade. In this case the camouflage is thin because any foreign trade in tungsten is inward not outward. The largest producer of tungsten in this country, the Atolia Mining Company, has refused to co-operate because it sees no valid reason for the step. Returning to copper, we note that rumor points at the probability of an open market for this metal in January, when the War Industries Board goes out of existence. It is expected that the price will recede and that some of the poorer mines, that is, those operating on a thin margin, may have to suspend work. What the effect of a drop, say, to 20 cents per pound, will be, it is difficult to gauge, because the statements of the producing companies do not afford an entirely reliable criterion of the cost of production. Such data are now given on a basis entirely different from the flamboyant assertions of the pre-War period when the public was being fed on optimistic estimates of 6 and 7-cent costs at the big mines the stock of which was being placed on the market. Then sundry 'overload' items, such as depreciation and depletion, were cheerfully ignored, now emphasis is placed on them; then the credit for the precious metals recovered from the copper ore was deducted from the cost of producing the copper, whereas now it is deducted beforehand in order to circumvent the tax-collector. Such 'book-keeping' makes a difference of from 3 to 5 cents per pound. The future of the industry depends upon the adjustment of the wage-scale; wages were raised in sympathy with the rise in the price of the metal, but, unfortunately, a corresponding decrease, which would be fair, is complicated by the question of living costs, which are likely to go down more slowly than either of the other two basic factors.

Boundaries: Racial and Natural

When the delegates to the Peace Conference begin to fix new frontiers for the disintegrated fragments of the old Europe, as we knew it on the maps printed before the War, they will find themselves approaching their task from different points of view. National boundaries used to follow physiographic lines, such as those of rivers and ranges of mountains; this method of delimitation was in general favor until the 19th century and the political writers of Europe, particularly the French, hardly considered any other idea until 1795. For example, today, should the Rhine be the north-eastern boundary of France and the Vistula the western frontier of Poland? In our own times the contrary idea of ethnic distinctions has become the dominant factor in schemes of territorial readjustment. The lines of demarkation are based upon the indefinite domain of language, on the common assumption that language goes with nationality, and that race is somewhat identical with one or both. For example, President Wilson, in the thirteenth of his Fourteen Points, has suggested that the new Polish State should include "the territories inhabited by indisputably Polish populations." Does that mean the Poland of 1659 or that of 1795? It would exclude Lithuania, although that province formerly was part of Poland; also Dantzig, which is a truly German city; and yet without the port of Dantzig and the province of Lithuania the restoration of Poland would come to a lame conclusion. Eastward the limit of indisputably Polish population is confused by admixture with the Russians and westward the line is lost in a twilight zone of Germanism; villages wholly Polish can be found dispersed among villages truly German; there is an interpenetration of national units so intricate that no line can be drawn by any maker of political maps. The people of Alsace speak German, yet their traditions are French, and they insisted upon being so regarded even when under the German flag. Switzerland has developed national unity, yet it is a tri-lingual country; in the west the people speak French; in the east, German; in the south, Italian. The test of language fails as a synonym for nationality. The Belgians speak more than one language, they had no national traditions until August 1914, when they created one that will endure. They consist of diverse peoples and have nothing in common with the Belgae of school-boy history; that pedigree is as fictitious as any that was ever resurrected

for the gratification of a plutocratic brewer by a subservient College of Heralds. The worst puzzle is that offered by the ramshackle empire formerly under Hapsburg rule. Even the recent disintegration into separate republics does not begin to be based upon racial unity; the diffusion of peoples has been so wide-spread that ethnic islands of alien blood and language are scattered all over the map. In the Balkans the conditions are even more complicated, if possible. Note how Rumania has a large Hungarian island in the middle of it, alongside an archipelago of German color. In truth the attempt to make a new map founded on either race or language is utterly futile. Even 'self-determination', now a popular term in liberal circles, is only, like Mesopotamia, a comfortable word. Self-determination is no more possible for every community or country than for the individual, whose rights have to be compromised for the sake of making a sane world. The multiplication of new republics, each with its own government, laws, and customs duties will bring Europe to the edge of chaos, especially at a time when the life of any one of these units is menaced by all the infantile diseases that menace a newborn State, more particularly those that have sprung like mushrooms from the damp soil of the blood-soaked battlefield. There must be give and take, reasonable compromise, and a willingness to subordinate the non-essential to the essential. The delegates at Versailles will realize that the drawing of boundaries can be fixed on no arbitrary theory of language or race, and that the natural frontier in many cases may prove the least unstable line for readjusting conflicting interests. What the world needs today is good government, not the political chaos of the Bolshevist; it needs the peaceful organization of human life, not the wild disintegration of repellent prejudices; it needs a reasonable spirit of compromise on the part of the individual for the sake of the general welfare, not the fierce assertiveness of the jungle.

The Utah Copper Enterprise

In this issue we publish the last of a series of articles on an enterprise that may fairly be regarded as the greatest copper mine in the world. It is a veritable mountain of copper ore and is yielding at the rate of 17,000,000 pounds of metal monthly. To those whose experience has been mostly in the winning of the precious metals, the sight of such a vast reserve of ore is astonishing. Usually the more difficult part of mining is to find the ore; it is to the uncertain distribution of gold and silver in veins and lodes that the speculative character of precious-metal mining is due. The search for ore overshadows the question of exploiting it cheaply. On the other hand, a mining engineer looking at the Utah Copper mountain realizes that the anxiety as to quantity is removed, all that remains is the application of skill in breaking, moving, and beneficiating the ore so cheaply as to ensure a profit large enough not only to amortize the capital required to establish systematic industry but to yield a profit commensurate with the financial risk involved in such an undertaking. The prospector stands aside; the engineer steps forward. Then is realized the definition of engineering as used in the charter of the Institution of Civil Engineers: "The art of directing the great sources of power in Nature for the use and convenience of man." The force of gravity, the energy of falling water, the heat latent in coal, and the expansion of steam are harnessed, like a quadriga, by him, in order that he may quickly and easily, and therefore inexpensively, break the metal-bearing rock, transport it, crush it, and subject it to a number of complicated processes so that at the end of a series of operations he may have marketable ingots of pure metal. Such are the operations that we have passed in review. The cost has ranged from 8.85 cents per pound in 1908 to 6.95 cents in 1916, rising, in consequence of war conditions, to 10.995 cents in 1917 and to over 17 cents per pound during the latter part of 1918. The profit has not paralleled the cost because the price of copper, ranging between 12 and 32 cents per pound during ten years, has been a decisive factor, compensating for the higher cost of war-time. The profit in 1914 was only 5.22 cents, as against a maximum of 19.22 cents per pound in 1916. In 1918 the profit will probably be between 8 and 9 cents per pound and the output about 203,000,000 pounds from about 12,600,000 tons of ore. The splendid earning capacity of the property has been obtained at the expense of metallurgical thoroughness. The prime purpose of mining is to make money, therefore the most efficient metallurgical practice is that which yields the largest dividends, making due allowance for the earning power of money and the prospective life of the mine. In Europe mines may be run with an eye to the interest of posterity; in this country our perspective is shorter and more practical. Shareholders prefer to re-invest their own winnings rather than postpone them for the enjoyment of their children or grandchildren. Hence methods that to a philosopher seem wasteful. The accumulation of residual tailing may become a source of revenue to others in days to come, the discard at the mine may prove attractive to the more skilful operator of a later period, but the salient fact is that the ore deposit is now being exploited in a manner likely to give the largest revenue to the present proprietary. That suffices, and more than suffices. To the daring and initiative that conceived the various stages of development and equipment the author of the articles has paid just tribute. The Utah Copper is an epitome of Western energy, resourcefulness, and persistence. To the end of the current year the mine will have produced 80,000,000 tons of ore averaging 1.4% copper, enabling the company to pay $92,015,782 in dividends and to accumulate nearly $50,000,000 in working capital, thus showing a total profit of $142,000,000 in eleven years. The figures are eloquent; they speak for the skill in controlling men and things that has been applied by Messrs. D. C. Jackling, R. C. Gemmell, George O. Bradley, Frank G. Janney, and the staff of young men whom they directed to this great accomplishment.

The Market for Silver

The Editor:

Sir—Of the 350,000,000 silver dollars authorized to be withdrawn by the Walsh-Pittman Bill, the United States Mint reports it has melted down 194,189,374 dollars up to October 1, 1918, and it has been estimated that by January 1, 1919, the remaining 156,000,000 dollars will have been melted down into bullion for export abroad. During the three months ending August 24, 1918, exports of silver were at the rate of 35,000,000 oz. per month or 420,000,000 oz. per year. That this rate of export will soon exhaust our supply of silver and cannot be maintained is self-evident when it is known that the annual production of this country is but 72,000,000 oz. We have been exporting nearly six times as much silver as we produce and our surplus stock of silver, the 350,000,000 dollars that were in the Treasury, will have been exhausted by January 1, 1919.

The average yearly production of silver for the whole world during the past three years is about 160,000,000 oz. It is estimated that all of 30,000,000 oz. annually is consumed in the arts and moving picture business. This estimate would leave but 130,000,000 oz. annually to meet the requirements of the world's mints for monetary purposes.

India is known as the 'sink' for silver. The average annual imports of silver into India for the 15 years beginning April 1, 1901, to March 31, 1916, was 83,136,000 oz. The average annual export of silver out of India for the same period of time was 16,530,000 oz. The excess of imports over exports was 67,606,000 oz. per year. This is why India is known as the 'sink for silver', for this metal never again re-appears in the markets of the world. During the 15 years considered above, over one billion ounces of silver has disappeared into this sink, never again to appear in the world's markets, and this same process has been going on for much longer than 15 years, and in all probability will continue at an increased rate in the future.

Subtracting the 67,606,000 oz. absorbed yearly by India from the 130,000,000 oz. of the available world's supply, after the demands of the arts have been met, we have 62,394,000 oz. left with which to meet the demands of the rest of the world for coinage purposes. How far this amount will go toward this end is indicated by the following figures.

The world's demand for silver for coinage purposes, outside the British Empire, has averaged for the period of 15 years, 150,000,000 oz. annually, or more than twice as much as will be available at the present rate of production after the demands of India and the arts have been satisfied. Re-coinage of old and mutilated coins and old silverware and jewelry has probably supplied 25,000,000 of this demand, reducing the actual amount to about 125,000,000 oz. Summing this up we have as follows:

	Oz.
World's demand for coinage, new silver annually	125,000,000
Arts and moving pictures, new silver annually	30,000,000
Absorbed by India, new silver annually	67,606,000
Annual demand for new silver	222,606,000
World's present rate of production	150,000,000
Deficit in production	72,606,000

The above facts and figures clearly indicate the favorable position in which the producer of silver is placed today. There is a deficit in production of 72,606,000 oz. annually at a time when all indications point to a greater demand for the metal than was ever known before. These figures indicate that the price of silver will not fall below the current quotation and lend additional strength to the current belief that the price of the metal will, when again governed by the laws of supply and demand, advance still higher in price. That there are additional grounds upon which to base this belief is shown by the following table of the world's yearly production and the average London prices per ounce in terms of United States currency:

Year	World's production	Average price per ounce cents
1911	226,000,000	53.928
1913	223,000,000	60.458
1915	178,000,000	51.892
1916	156,000,000	68.647
1917	150,000,000	81.417
1918	143,000,000	96.772

Thus we see that since 1911 there has been a steady decrease in the production of silver in spite of a steady increase in price. Certainly, if figures can be relied upon, these figures show that the most prosperous period the silver miner ever knew awaits him, even if there were to be no greater demand for the metal in the future than there has been in the past.

There is every reason to believe that there will be a greater demand for silver. As one of the results of the War, the standard of living in the Orient has been raised. The Orient has grown rich through supplying the needs of the Allies. The wants of the Orient will increase steadily. England is reported to have put 1,500,000 Hindu soldiers under arms; these troops have been out of India most of the time and have been introduced to new and strange commodities and ways of living; they will introduce them at home when they return. Thou-

sands of Chinese have been used by the Allies back of the battle-lines; these men will be returned to their country and introduce new wants among their people. This means a steadily increasing demand for silver for this new wealth and higher standard of living will enable the Orient to absorb it in greater amounts than ever before.

The above facts and figures explain why China is offering $1.16 to $1.20 per ounce for silver and cannot get it. As soon as the war restrictions are removed by the Government, silver will advance in price because England, the United States, India, and the Allied nations will then have to compete in the open market with the rest of the world for silver, the present rate of production of which is shown to be abnormally low. After the first of the year the 350,000,000 silver dollars that were in the American Treasury will be gone, and there is no other large stock available.

The Walsh-Pittman Bill was rushed through Cangress. There was no opportunity given the mining men to protest against it, if they had been so inclined. They knew that the price at which this silver was to be sold, $1 per ounce, was below what it will cost to replace it, but with them it was anything to win the War. A promise was made them that eventually this silver would be replaced in the Treasury. This means that the United States must become a large buyer of silver for many years in the future, in competition with other buyers of the world. Truly the position of the silver producer would seem to be the brightest it has ever been. A revival of silver mining is in sight.

M. T. Chestnut, Jr.

Denver, Colorado, December 12.

[The silver market is sensitive in spite of Government support. On September 3 the British Treasury, following the action of the United States, fixed the maximum at 49½ pence. Reduced rates of war-risk insurance caused a fall of ¾ pence in London on November 12. The British Treasury immediately fixed a new maximum at 48¾ pence. Unseasonable weather in India has caused a recent slackening of demand for silver.—Editor.]

Platinum in British Columbia

The Editor:

Sir—Having, with a partner of mine, spent over four hundred dollars and three months time—to say nothing of breaking up a school-year at Washington State College—in grubstaking Mr. J. C. Reilly and in prospecting myself for platinum on Olivine mountain in British Columbia, the discussion regarding it interests me considerably. Professor Kemp, in U. S. G. S. Bulletin No. 193, tells in minute detail the story of the platinum-bearing chromite in the basic eruptives of Olivine mountain. His conclusion, as emphatically corroborated by my experience, is that the chance of finding platinum in sufficient quantity to mine is very small. Just consider the fact that this area of from 30 to 40 square miles of platinum-bearing eruptives (olivine, pyroxene, serpentine, etc., has yielded through all the ages it has been wearing away, in the creeks that flow from it, a concentration of much less than a million dollars worth of platinum. The scores, perhaps hundreds, of residents of Hedley, Princeton, and other towns on the upper Similkameen river, who have been 'stung' with 'platinum claims' and 'diamond claims' on and around Olivine mountain, must certainly feel the same way about it.

C. Roy Price.

Martinez, California, December 10.

P. S. A pertinent comment on this subject is to be found in the fourth paragraph on page 537 of 'The Mineral Industry' for 1901.

Conditions in Russia

The Editor:

Sir—The Allies have been policing certain notable parts of China since 1900, and, to some extent, previous to that date. There have been, in the region of Tientsin and Peking, an average of 5000 foreign troops constantly during this time, the reason for this being the instability of the Chinese government and the danger to foreign lives and trade if reliable armed protection was not available. Another object in leaving foreign troops in China has been to assure the uninterrupted operation of part of the North China Railway, extending from the port of Chinwangtao to Peking, about 200 miles, and to assure the safety of the foreign legations at Peking. In the case of Russia, we have a much richer and less developed country peopled by a white race, which, for many of the necessities and most of the luxuries of life, is dependent on the outside world. Most of the foreign trade of Russia previous to the War was in German hands. Bolshevism, with the aid of German organization, has utterly prostituted Russia. No general organized government exists. Thousands of the property-holding and business people of the country, as well as more of the poorer classes, have been foully murdered. Millions of dollars worth of property has been destroyed, hundreds of thousands of people rendered homeless, all manufacture stopped, all foreign trade, all government, except a few feeble local provincial administrations, have been absolutely disorganized. In some parts of the country food in plenty exists, and in others there is starvation. In Russia proper there is no sugar, leather, hardware, tobacco, or clothing, and in Siberia, which has had some communication with the outside world, the situation is but little better. Order is maintained in parts of Siberia only by the presence of Czecho-Slovak troops and a few Cossacks, with newly-organized and untried Russian levies and a handful of Allied troops. The people have neither the initiative nor the experience to organize a stable government or to police the country. What little initiative they had is gone; they are worn out and tired of the various untried doctrines and experiments in government that have been thrust upon them. They want only peace and someone to tell them what to do. There are no developed political parties with leaders capable of commanding re-

spect. The only apparent solution of the problem is for the Allies to unite and police the main lines of communication, see that provisions are distributed, and give the people a chance to recover and take up their own burden. We cannot afford to see one of the richest parts of the world turned into chaos or worse; we ought to go and show this people that we are going to stand for the square deal and honest administration by the actual presence of Allied forces. Also, we want a hand in the development of the country and in the trade resulting from that development. Russia, in its present state, or without Allied control, is, and will continue to be, a constant menace to the peace of the adjoining countries and to the world at large.

San Francisco, December 10.

The Future of Manganese

The Editor:

Sir—Leonard G. Blakemore, in your issue of November 30, writes concerning the manganese situation from the producer's standpoint and asks why a tariff should not be placed upon manganese ore to prevent its importation. There are two chief reasons why a tariff will not be placed on this ore. In the first place, no matter how much tariff is imposed, no matter how much Government assistance is given, the United States holds no promise of ever producing an appreciable amount of high-grade ore. So far as investigations have gone it has been proved that no important bodies of high-grade ore exist within our territory.

In the second place, there were less than 150 properties producing ore of 35% MnO_2 or better six months ago and they averaged only about 200 tons per month each, which means that a very small number of persons was engaged in its production, while there are many thousands interested in the consumption of the metal. It is contrary to the prevailing spirit in America to tax the public permanently for the benefit of a few. I am one of 150 stockholders in a small gold mine; 150 of us as stockholders and as many more dependent upon the mine for a living, are using manganese-steel in the crushing of our ore; we have seen the price of this advancing for several years; to be sure, it is not a large item on our expense-sheet, but only one of those the sum of which is now making our gold cost pretty close to $20.67 per ounce. Three hundred of us believe that the price of supplies, including manganese-steel, ought now to be coming down. If they do not we will simply have to quit; naturally we are going to object most strenuously to the imposition of tariffs that will tend to keep up our high cost.

The manganese producer occupies the same position as the producers of hundreds of war-time articles, the production of which must cease when the market for the high-priced article is gone. We do not live in a charitable, altruistic world, but one where the survival of the fittest is the inflexible rule. Within a few months' time Brazil, India, and Russia will, as formerly, be supplying us with the greater part of our high-grade manganese ore and Mr. Blakemore's mine will be closed, as will have been my gold mine without the fall in prices.

New York, December 6.

The Chrome Scandal

The Editor:

Sir—I wish to thank you for your frequent and timely editorials on the subject of the chrome scandal. I have had occasion to follow closely the course outlined by the Government in the early encouragement of chrome mining, especially since this company received direct assistance through members of the Bureau of Mines, in starting an enterprise in Oregon for the purpose of producing chromite.

I can verify the article in your recent issue of December 7 for the reason that owners of undeveloped chrome properties were verbally induced to lease their holdings to us because we were known to the Government as operators who would perform in accordance with our contract. We offered a fair royalty, which was declared by representatives of the Government to be just, and property owners were recommended as a patriotic duty to offer us leases. Complying therefore with the Government's encouragement and recommendations, we undertook the operation of several tracts and purchased therefor some very expensive concentrating machinery. This equipment has reached the point of operation and is ready to be set up. About this time, however, the market began to decline and we found we were unable to obtain long-term contracts. Shortly the armistice was signed, and the chrome market fell to pieces.

Up to the present time we have over $25,000 invested in equipment, advance royalties, engineering and traveling expenses, metallurgical tests, etc. When the United States government admits its moral responsibility to the chrome producers, and still refrains from taking any constructive action for the effective re-building of the industry, we must come to the conclusion that the right way out has not been suggested and approved. I have read of the cancellation of munitions orders which were issued and have been followed up by competent members of the various Government departments who undertook to appraise the amounts actually invested by private capital in carrying out the orders which had been issued. A nominal profit of 10% was then allowed, and the cost and profit together formed the basis of the Government's obligation to the holder of the contract.

Why could not the Government work out some such adjustments in the chrome industry, either under a technical interpretation of the phrase "for the National security and defence" or some other clause of the Minerals Control Act, or, if the Minerals Control Act is not subject to such interpretation, why not pass some legislation to permit Government obligations to be met in the manner above suggested?

I desire to promote discussion on constructive lines in order that all phases of the chrome situation can be

brought to the attention of the proper authorities in order to secure remedial action for a much distressed industry.

JUSTICE F. GRUGAN,
Chief Engineer to the Suffern Company.

New York, December 11.

Why Not Domestic Ores First?

The Editor:

Sir—Mr. Blakemore's letter under the above heading in your issue of November 30, respecting the protection of the manganese ore mines, suggests this thought: which predominated when he invested in his mining plant, the idea of making a large profit quickly or patriotism? We can conceive of only these two reasons for his having gone into the business; they are distinct, and one man could not have held both at the same time.

If the former, he used his best judgment, taking not only the ordinary mining risk but a war risk in addition. He knew that if he could get going quickly and the War lasted for some time he would be handsomely paid for his risk; he also knew that the day peace was declared the bottom would fall out of the manganese ore business. It may be a new experience for Mr. Blakemore to be stung in the mining business; I have been hit several times, but it had not occurred to me to ask the Government to make good my losses. It may be that Washington will be good to Mr. Blakemore, but I doubt it.

If it was patriotism that induced some miners to go into the mining of manganese, that is quite another matter; we sympathize with them as we sympathize with others who have given property and life for the cause of liberty, but patriots are neither asking for sympathy or the return of their money or their dead. They gave freely, they were happy that they could give, and they have charged up their losses as their 'bits' in the winning of the War.

A. MINER.

New York, December 6.

[This is not altogether fair. A man may have started to dig manganese ore with mixed motives, partly for gain and partly for patriotic purpose. Not many men know the exact motive from which their action springs. Even 'patriotism' can be viewed as a selfish gratification of sentiment. No, we disagree with the criticism of Mr. Miner.—EDITOR.]

A Friendly Greeting

The Editor:

Sir—Your subscribers are greatly indebted to you for the highly patriotic editorials presented through your columns during each phase of the War and for re-publishing articles of such enormous value as that of 'The Battle of the Hindenburg Line', which otherwise might have escaped notice. Now that we are entering the reconstruction period, even greater precaution will be necessary on the part of all patriotic engineers, because of the unceasing and continued efforts of the Emeny to take advantage of the restraint that has been thrown off by reason of the armistice.

Some few of us that have been called upon to take the place of Germans in the past years, know the insidious character of our enemy, probably better than younger engineers. This is the time to be on guard at home—as well as in Germany—to ascertain in the questionnaire of each applicant for service that the applicant has not been a slacker at home, in the non-purchase of war stamps or bonds, if sufficiently able financially to do so. I personally know of such men in our midst. It is unfair to that vast majority of labor that has been so loyal, to employ such slackers, regardless of labor shortage, in the face of the great sacrifice that has been made by the brave boys that have given their lives that those that could not go might enjoy liberty.

Slackers of this variety should be banished from our shores because they evidently belong with the Bolsheviki, who were organized by Germany to exploit Russia, so successfully that its backfire is now reaching the place of origin.

Your reference to certain yellow journals is especially good. These have proved how close they could go toward meriting internment without actually being interned. This has emboldened them to use every effort, at the present moment, to produce friction between us and the Allies, and more especially between the United States and England. It is by such means that Germany yet hopes to win this war.

With the removal of the executive portion of our Government from Washington to Paris the reconstruction period indeed offers a problem that only the best posted men of the Nation can possibly save from another host of errors, if not from serious mishap.

W. W. WISHON.

Searchlight, Nevada, December 15.

CRUCIBLE manufacturers are now using 20% or more of domestic flake graphite in their crucible mixtures, so the demand for the domestic product has been rather stronger than it was during the first few months of the year, according to the U. S. Geological Survey. There appears to be a good demand for No. 1 flake of 85% carbon standard at 15 cents per pound, f.o.b. mines. The demand for the 90% grade is not so good, though some has been sold at the high price of 20 cents. According to a resolution of the War Trade Board dated November 7, 1918, the present import restrictions on graphite are to be continued in force until June 30, 1919, unless otherwise ordered by the Board.

OPERATIONS at the Philadelphia Mint of a 1000-lb. Rennerfelt electric melting-furnace has shown that melting silver, nickel, and bronze alloys by electricity is economical and saves both time and labor. Tests have been satisfactory, indicating savings in the cost of melting approximating 40%. It is proposed to establish electric-furnaces at the San Francisco and Denver Mints.

THE GARFIELD SMELTER OF THE AMERICAN SMELTING & REFINING CO. AT GARFIELD, UTAH

The Utah Copper Enterprise—IX

The Smelting of the Concentrate

By T. A. RICKARD

The products of the Arthur mill, as we have seen, consist of two kinds of concentrate, one made by water and the other made by flotation. These concentrates are mixed before being delivered to the filter-plant, so that the final output of the mill is a product containing, on average, during 1917 for example, 14.82% copper, 26.79% iron, and 21.69% insoluble, together with 13.6% moisture. The last item is of greatest importance to the smelter, as we shall see. Formerly the table concentrate and the flotation concentrate were shipped separately, the first containing about 8% and the second from 20 to 25% moisture. They used to be loaded into the cars together, not properly mixed, the consequence being that accurate sampling was rendered impracticable, for the flotation concentrate was much richer in copper, containing 20% as against 12% in the table concentrate. So it was decided to ship these products separately, in order to facilitate sampling, but the cars containing the flotation concentrate had to be left on a siding for a week or more in order to allow the water to drain. Finally the management at the mill devised the scheme of mixing the table concentrate with the flotation concentrate in the Dorr thickener before filtering, thereby yielding a product containing 16 to 17% moisture. This was material that, it was thought, could be sampled fairly well.

However, before discussing this tender subject further, let us go to the Garfield smelter, to which the concentrate from the Arthur mill is consigned under contract. This smelter belongs to the American Smelting & Refining Co., it is only two miles from the Arthur mill, and stands on the shore of Salt Lake, near Black Rock point. The Garfield smelter treats only custom ores. At the present time 60% of the gross tonnage of ores comes from the Utah Copper company. Only a small proportion of precious-metal ore, averaging 10 oz. silver, is included in the receipts, the richest containing 32 oz. silver per ton and being used in the converter owing to its high content of silica. The 24.6% insoluble in the flotation concentrate from the Utah Copper contains 6.7% alumina and 16.9% silica.

The manager of the plant, R. F. McElvenny, was most courteous, and A. H. Richards, the assistant-superintendent, was kind enough to conduct me through the works.

A car of flotation concentrate from the Ohio Copper company was being unloaded. It contained about 25% moisture, and while watching the shoveling one could realize what trouble the Utah Copper product used to give to the smelter people. The flotation concentrate arrives in flat-bottom cars having a floor of wooden slats on which cocoa matting is spread so as to serve as a filter through which the water can drain. The car arrives with a pool of water on top; in winter this takes the form of a cake of ice two or three inches thick. From November to March it is customary to run the cars into a thawing-house. This is a brick building provided with four tracks giving room for 12 cars apiece, so that 48 cars can be thawed concurrently. In this building is a pit covered with cast-iron (one inch thick), under which is a big brick flue through which hot air passes from a furnace fired with coal. A temperature of 110° is maintained. Usually 24 hours suffices to thaw the concentrate, but if

MAP OF PART OF UTAH, SHOWING THE POSITION OF GARFIELD, ALSO THE MAGNA AND ARTHUR MILLS

it is frozen solid, the period of thawing may be lengthened to two whole days.

The unloading is performed under contract with gangs of Greeks, also a few Japanese. These men expect to earn from $6 to $7 per day, for they work hard. The price for unloading concentrates from the Utah Copper mills varies with the moisture; for table-concentrate it is $9.60; for mixed table and flotation concentrates it is $11.50; and for straight flotation concentrate, $13.35 per railroad-car. The price of $11.50 for the mixed product was maintained only during a short period, because this material was so sticky, the unloaders insisting that it was as bad as the unmixed flotation concentrate, so that recently $13.35 has been paid for unloading the mixed concentrates. Since my visit a general rise in wages has lifted the contract prices to $10.60, $12.50, and $14.35 for the three classes of material; and, as a matter of fact, it has been found necessary to pay $14.35 on all the concentrates. A car holds 70 tons and the crew that does the shoveling consists of 8 men. The price is determined by agreement before the job is tackled. In order to ascertain the proportion of moisture, holes are dug into the concentrate at two points, each one-third of the distance between the centre and the ends of the car. Both holes are dug right down to the bottom of the car and a sample is taken from each hole by means of a spoon or scoop, which is an inch wide, three inches long, and is provided with vertical sides that give a depth of one inch. In taking this moisture-sample a uniform slot is cut on the face of the hole from the top of the load of concentrate to the very bottom of the car. While visiting the unloading-shed, above the receiving-bins, I found that a gang of shovelers had struck, demanding $13.35 for unloading a car of Utah Copper concentrate that happened to be unusually wet. It was, they claimed, a load of flotation concentrate unmixed with table concentrate. These men knew the difference. They stopped work, but the difficulty was adjusted later.

Every tenth shovel from the railroad-car is thrown onto a platform where it is half-shoveled twice, one quarter being shoveled into a car that delivers it at the sampling-room. From a small bin it is drawn onto a steel floor, upon which it is reduced by successive quartering to a sample of 200 pounds. The operator throws every other shovelful into a wheelbarrow in order to decrease the labor involved, the stickiness of the concentrate rendering it impracticable to make a regular cone. He simply shovels toward the centre, makes a heap, and then flattens the mass, using an iron sector to mark the quarters.

From the receiving-bins the ore is conveyed on a belt to the bedding-bins, whence it is discharged into lorries. Each of the four bins is 20 ft. wide and holds 7200 tons, occupying a building that is 80 ft. wide by 540 ft. long. The discharge is done by using a pick to move the boards on the bottom of the bin, which are made hopper-bottom by allowing the ore to collect at the sides. Five men are employed to empty the bin and load the lorry.

A 10% addition of silicious oxidized ore, containing 50% SiO_2, is added to the concentrate in these bins. Lime, in the proportion of 10%, is added on the fifth hearth of the roasting-furnace, so as to obtain an intimate mixture. The lime used at this smelter is in the form of sand from the shore of the big lake, a deposit of it having been discovered and first used by W. H. Howard in 1909. It contains 48% CaO and 9% insoluble.

In approaching the roaster I heard a noise that furnished further evidence of the difficulties made by the millman for the smelter. Three men were engaged in hammering the lorry, one poking with a crowbar from above, while two were hitting the sides with a special implement, namely a bar having a knob at each end. Thus even in summer the stickiness of the concentrate gives this further trouble. In winter the difficulty of unloading the electric lorry is increased, of course. It appeared a pathetic performance in this age of proud efficiency, but I confess that by this time my sympathy had

UNLOADING FLOTATION CONCENTRATE AT THE GARFIELD SMELTER

veered to the smelter-people, who, it seemed to me, were called upon to overcome difficulties that had been passed to them from the mill. Mr. Richards informed me that his operations were curtailed frequently, especially during winter, by the inability to get the concentrate out of the railroad-cars and then by the difficulty of feeding it to the roasters; even after it has been mixed with 10% of silicious ore, it is difficult to ensure a uniform feed to the furnace. This is true of operations during the winter, but in summer also there is trouble in feeding concentrate to the roasters. In a recent letter from Mr. Richards he says: "I was over to the roasters this morning and found that the product we are now receiving is 'bridging' in the hoppers of the Call-Wagstaff furnaces. You will recall that this set of roasters has the apron-feeder underneath. I counted no less than 12 men poking the charge out of the hoppers, so as to get it into the roasters, and even at that our reverberatories were curtailed owing to not being able to obtain sufficient calcine." No metallurgist can refuse his sympathy to a superintendent compelled to roast undried flotation concentrate.

New cars are to replace the lorries now in use; three of them will constitute the train to be pulled by the electric locomotive; they will carry 20 tons divided in two compartments, having vertical sides, so that when the bottom drops the load will fall promptly.

Of the various feeders, the Stevens-Adamson apron appears to work best on wet material. This feeder has a storage-hopper, two sides of which are vertical, whereas the other two slope at 70°. A 40-in. belt of overlapping corrugated steel slats 4 in. wide moves the ore, the flow of which is regulated by a gate, giving an opening 12 in. high and 36 in. wide. I saw what an inefficient feeder, of another type, will do. The concentrate stuck so as to bridge the opening and stop the feeding.

The roasters at Garfield are of the McDougall type, with rabbles having straight blades set at 45°, except on the top hearth, where the angle is 60°. The blades have a 3-in. sweep and are 6 in. apart. In order to prevent clogging by the flotation concentrate, it is proposed to widen the blades from 7 in. to 11 in. on the topmost hearth, where four arms with rabbles spaced 9 in. apart are in use. The roasting-plant contains 48 furnaces, divided as follows:

10 Herreshoff furnaces, with seven hearths of 19½ ft. diameter.

8 Call-Wagstaff furnaces, with eight hearths, also 19½ ft. diameter. This furnace was designed by R. A. Wagstaff and B. G. Call, members of the staff.

16 McDougall furnaces, of six hearths, 18 ft. diameter.

14 McDougalls, six hearths, of 19½ ft. diameter.

The cars that take the roasted ore to the reverberatory furnaces are not covered. Hereafter, while being loaded they will come under a hood that has an opening, with a slight suction into a flue, for the collection of dust. This arrangement is not yet in use, but it has proved successful at the Tacoma smelter. Hoods have been built above eight new roasters and provision made to connect these hoods with the flue, but this improvement is being delayed by the need of covered calcine-cars. It is intended to cover the cars and to double their size; also to provide a tight connection between the hopper of the reverberatory and the car. All such betterments are delayed by the inability to obtain quick delivery of material. In these matters of dust-control the International smelter at Miami is so much better equipped that I venture to

express surprise at the fact that the experience obtained there had not been utilized at Garfield. In my article describing the International smelter I gave details and also drawings of the appliances there in use.[1]

The feed to the roasters contains 14 to 16% copper, with 29 to 30% sulphur. After roasting it contains 16 to 18% copper, with 10 to 12% sulphur, having lost 12% moisture. The roasted ore is smelted in reverberatory furnaces, fired with pulverized coal, yielding a matte containing 42% copper and 25% sulphur. About 10% of the sulphur is eliminated in the reverberatory. The matte is treated in converters that yield blister copper 98% fine. This goes to the refinery at Baltimore, Maryland.

A question arose among our party as to the proportion of power used in the various stages of treatment to which the Utah Copper is subjected. It was ascertained that the refinery produced 170 lb. copper, the smelter 80 lb., and the concentrator 34 lb. per kw-day.

Returning to the question of moisture in the concentrate, it used to be the practice at Garfield to unload it upon belt-conveyors and bed it directly with the crude ore going to the blast-furnaces. At times as much as 10% of the blast-furnace charge was flotation concentrate, but the loss in dust was excessive. At the time of my visit shipments of flotation concentrate were being received from the Engels Copper Mining Co. in California. In order to minimize the cost of transport, this company reduces the moisture as much as is practicable, bringing it down to about 9%, which makes it slightly dusty. Apparently a 10% moisture is low enough for operations at the smelter.

On enquiry I was informed by Mr. Elmer E. Paxton, manager for the Engels company, that two Oliver filters are in use in his mill and that the dewatering of the concentrate is facilitated by a liberal use of steam, in three ways: (1) Steam is introduced through the emergency pipes, the air being excluded occasionally while the steam is admitted to the lifts. (2) Steam is forced through the feed-pipe to the bottom of the settling-tank, so as to warm, but not agitate, the concentrate just before a charge is drawn from the settling-tank into the filter-tank. While one charge is filtering, the next is being warmed. (3) A strong jet of steam is applied, through a pipe and hose at the back of the filter, so as to loosen and warm the bank of concentrate that forms in the bottom of the filter-tank. Thus the moisture in a two-inch cake is reduced as low as 10%. The average moisture in the concentrate shipped during May was 11%, this being reduced, by evaporation, to 9.5% by the time the concentrate reached Garfield.

The Ohio Copper company, at Bingham, has adopted the Lowden dryer. This machine is manufactured by the Colorado Iron Works, at Denver. It is designed to treat plastic material, such as flotation concentrate, without excessive loss in dust. The dryer consists (See Fig. 1, 2, and 3) of a single hearth made of cast-iron plates *A*, beneath which is the flue *B*, through which the gases of combustion pass. The feed is moved forward by means of rakes *C*, bearing rabbles *D*. These are right and left hand, in order to impart a ploughing action and distribute the material over the hearth. After the forward stroke, the rakes lift and clear the top of the material for the return stroke. The rakes move close to the hearth, preventing any caking, which would hinder the transmission of heat. The 'balling' of the plastic concentrate is minimized by the fact that the length of the stroke is less than the distance between the transverse rows of rabbles, so that, in descending, they enter the material where it has been left in ridges by the preceding stroke. Any lumps are broken by a roller placed between two

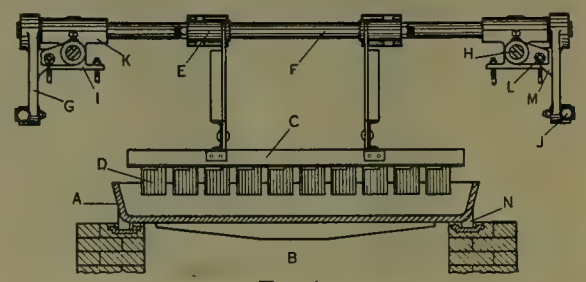

FIG. 1

rows of rabbles at the point where such lumps are in the most friable condition. Ample provision is made for expansion and contraction wherever parts are exposed to

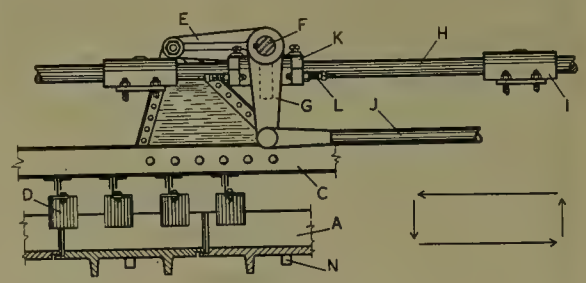

FIG. 2

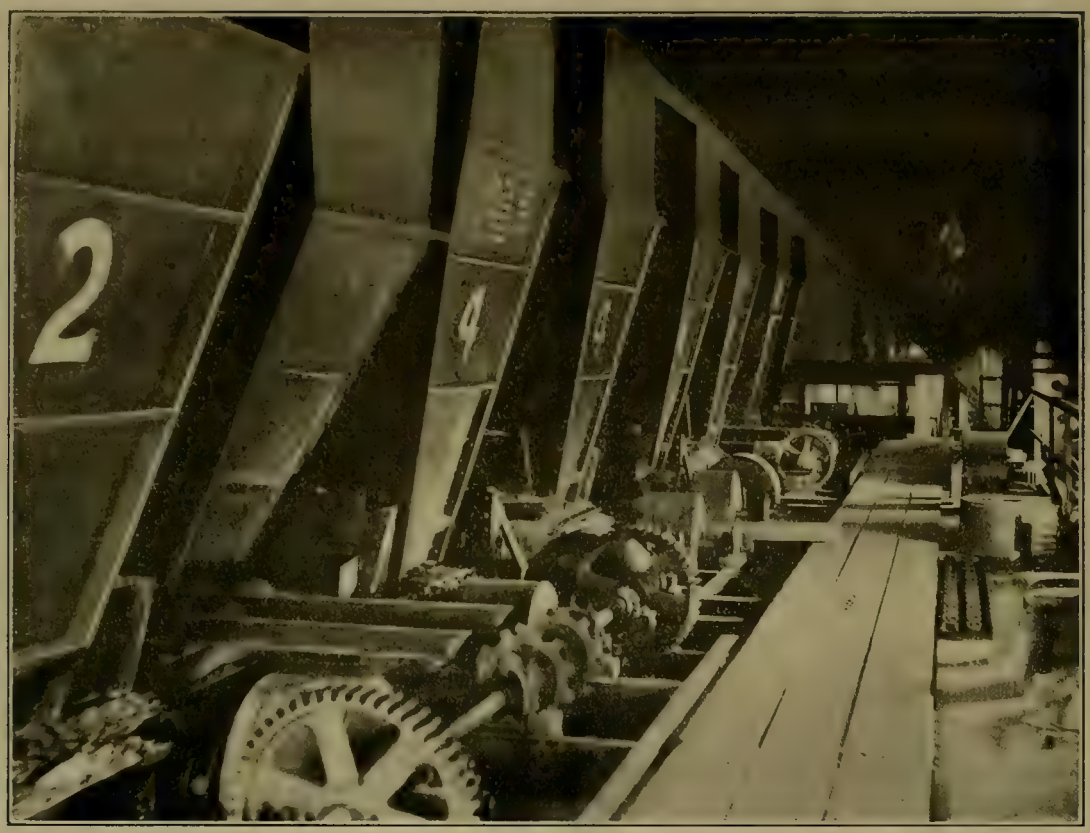
heat. The following data show the results obtained in practice at three plants:

Company	Moisture in feed %	Moisture in product %	Coal per ton of dry solid lb.
Federal Lead	15	5	117
St. Joseph Lead.....	16	5	125
Vindicator Consolidated..	29	13	128

In each case the temperature of the feed was 55°, and that of the product 212° F., or the boiling-point of water. The concentrate from the Ohio Copper mill contains 12% moisture, with which the superintendent of the Garfield smelter is quite satisfied. On the other hand, Mr. Janney tells me that the moisture in his concentrate during April averaged 12.83%, in 425 cars containing 30,898 tons, each car carrying 72.7 tons wet or 63.36 tons dry. Apparently the stickiness of the Utah Copper product is due to the large proportion of insoluble matter in the concentrate produced by the pneumatic flotation-cells.

This problem of drying flotation concentrate, so as to

[1]See M. & S. P., December 1, 1917.



A BATTERY OF STEVENS-ADAMSON FEEDERS

deliver a product suitable for unloading, conveying, and sampling at smelters, must be faced. So far, whether at Miami, at Ray, or at Garfield, the mill-people have 'passed the buck' to the smelter-people, who are tied by contracts that were signed before the true character of flotation concentrate was appreciated. I find that as between the managers of mills and smelters, the former always deliver a product containing less moisture than the same product contains on arrival at the smelter, despite such drainage and evaporation as may ensue in course of transit. This is a discrepancy that may be due more to a human factor than to one that is technical. It would be to the advantage of all concerned if the concentrate could be turned out in a form convenient to handle. Meanwhile the experiment being made with the dryer at the Ohio Copper is most interesting; there the dryer is placed at the discharge from the filter, as it should be, so that the concentrate drops from the filter upon a hearth of the same width as the filter. I may add that a rake-conveyor was used to cool and convey hot material from the Argall roaster at the Portland mill near Colorado Springs, in 1902.

Would nodulizing be advantageous? That would be the next step after drying. Nodules of, say, half-inch size, would be most convenient to handle and would give a feed suitable for the reverberatory or even the blast-furnace. At Braden the flotation concentrate is adapted for the blast-furnace by nodulizing in rotating kilns,[2] heated by oil-burners to a temperature of 1750°F. The sandy concentrate, containing 17% silica, is heated to a

CLOSE VIEW OF CONCENTRATE FEEDER

sticky consistence, due partly to the combustion of the part of its sulphur content, so that the rolling motion causes it to ball into nodules. The kilns are sloped an inch per foot toward the discharge, from which the red-hot nodules drop upon an endless chain of cast-iron pans,

[2]M. & S. P., February 12, 1916.

which convey the product to hoppers that feed the blast-furnaces. In the course of this process the sulphur is reduced from 28% to 18%, and, of course, the moisture has been evaporated.

Nodulizing has been tried also by the Canada Copper Corporation at Princeton, British Columbia, by R. M. Draper.[3] A rotary kiln borrowed from a cement plant was used. The kiln was 7 ft. wide and 125 ft. long, or about 25 ft. longer than was required for the nodulizing of the copper concentrate. About 82% of the sulphur was retained in the nodules, this being important in a region where the sulphur is required for smelting. Pulverized coal from a neighboring mine was the fuel used, the kiln itself being operated by electric power. It was estimated that a 100-ft. kiln of this type would nodulize 100 to 125 tons of flotation concentrate in 24 hours. At Chrome, New Jersey, a similar experiment was made, by Mr. Draper, on flotation concentrate from the El Cobre mine, in Cuba. The consumption of oil, as fuel, was 6 to 7 gallons per ton of concentrate. The nodules proved satisfactory for blast-furnace smelting when charged cold, but there was trouble with crusts on the furnace when too much of the hot nodules was introduced, owing probably to the fact that "they were near the smelting-point when charged into the furnace and naturally smelted much higher up in the furnace." I quote Mr. Draper. The concentrate averaged 30% sulphur, whereas the nodules averaged 14%. One sample of nodules chilled immediately in water had a sulphur content of 20%. A screen-test of the nodules showed that all the product was under half-inch, but only 4.78% was finer than 16-mesh.

Desulphurization would accompany nodulization. A product containing 10 to 11% sulphur and about 16% copper would be most suitable for making a 40% matte. Unless desulphurized sufficiently the delivery of nodulized concentrate at the smelter would conduce to a low temperature in the roaster, so that the smelter-people would not regard this step as an advantage. In short, if any desulphurization is to be done at the mill, the operation must be completed to the point of rendering unnecessary any further roasting at the smelter itself. Moreover, the smelter company, in making a rate for treatment, includes a charge for expelling both the water and the sulphur in custom ores; it would lose this source of profit if the preliminary operations were performed at the mill. On a long haul, like that of the Engels product, the removal of both moisture and sulphur would effect a considerable economy. Thus there are various conditions, technical and commercial, to be considered.

One would expect to find the Cottrell precipitator attached to the roaster, but at Garfield this precaution is only applied to the converters. How great the loss of copper in dust from the dryers would be, for example at Miami, if the Cottrell tubes were not used, was shown to me by L. O. Howard, the superintendent, who had the electric current turned off for a minute so that I might see the effect, which was to change a nearly colorless smoke into one heavily laden with dust. At Miami the flotation concentrate is not desulphurized, only dried, in the roasting-furnace.

At the Nevada Consolidated smelter, at McGill, Nevada, the gases from the roaster contain such an excess of water, owing to the high proportion of moisture in the concentrate, that it tends to condense with the sulphur tri-oxide, forming sulphuric acid, which attacks the brick of the flues and the iron of the jack-arches. At Garfield such trouble is avoided by causing the roaster gases to join the reverberatory gases, thereby maintaining a high temperature. The withdrawal of too much heat from the stack affects the dispersion of the fume and is likely to cause the destruction of vegetation. The wise smelter-manager avoids trouble in that direction.

Evidently the technical staffs of the mill and smelter should co-operate to solve this problem of drying the concentrate. As the proportion of table concentrate decreases, and more slimy flotation concentrate is produced, this phase of flotation practice will increase in importance.

The smelter occupies a picturesque site. Looking northward, across the marshes, the pavilion and long trestle of Saltair can be seen projecting into the lake, and beyond them the mountainous mass of Antelope island, now remarkable for its herd of buffalo. Turning around to the overlooking Oquirrh range, the eye rests on the level contour of a bench of gravel and other parallel terraces, which suggest old shore-lines. Such indeed they are, harking back to a time humanly remote but geologically recent.

The greater Salt Lake of the olden time is known to geologists as Lake Bonneville, that being the name given to it by G. K. Gilbert,[4] who published a monograph on the subject in 1890, under the auspices of the U. S. Geological Survey. These former shores were noticed by the explorers of 1849 and 1850; they surmised the previous existence of a lake vastly larger than the present one. The drift-wood found on beaches five feet above the lake indicated the recent recession of the waters and suggested that a recession on a larger scale had caused a greater shrinkage of the lake in a former geologic period.

The Lake Bonneville of geology was named by Gilbert after Capt. B. L. E. Bonneville, an Army officer who explored this region in 1833 and made notes that were published, with a map, by Washington Irving, in 1842. Lake Bonneville flourished in Pleistocene time; it had a length of 346 miles, an extreme width of 154 miles, and a depth of 1050 feet; it covered 19,150 square miles, as against the 2170 square miles of the existing lake. For

[3] 'Nodulizing Flotation Concentrates'. 'The Canadian Mining Journal', August 1, 1918.

[4] He died, I am sorry to add, on May 1, 1918. In anticipation of his 75th birthday, on May 6, a number of his friends had arranged by correspondence to celebrate the event by a presentation. The 'Lake Bonneville' monograph is No. 1 in that series of U. S. Geological Survey publications, because No. 1 had been set aside for a treatise by Clarence King, who failed to write it, so 'Lake Bonneville', which was intended to be No. 9 or No. 10, was given the place of honor.

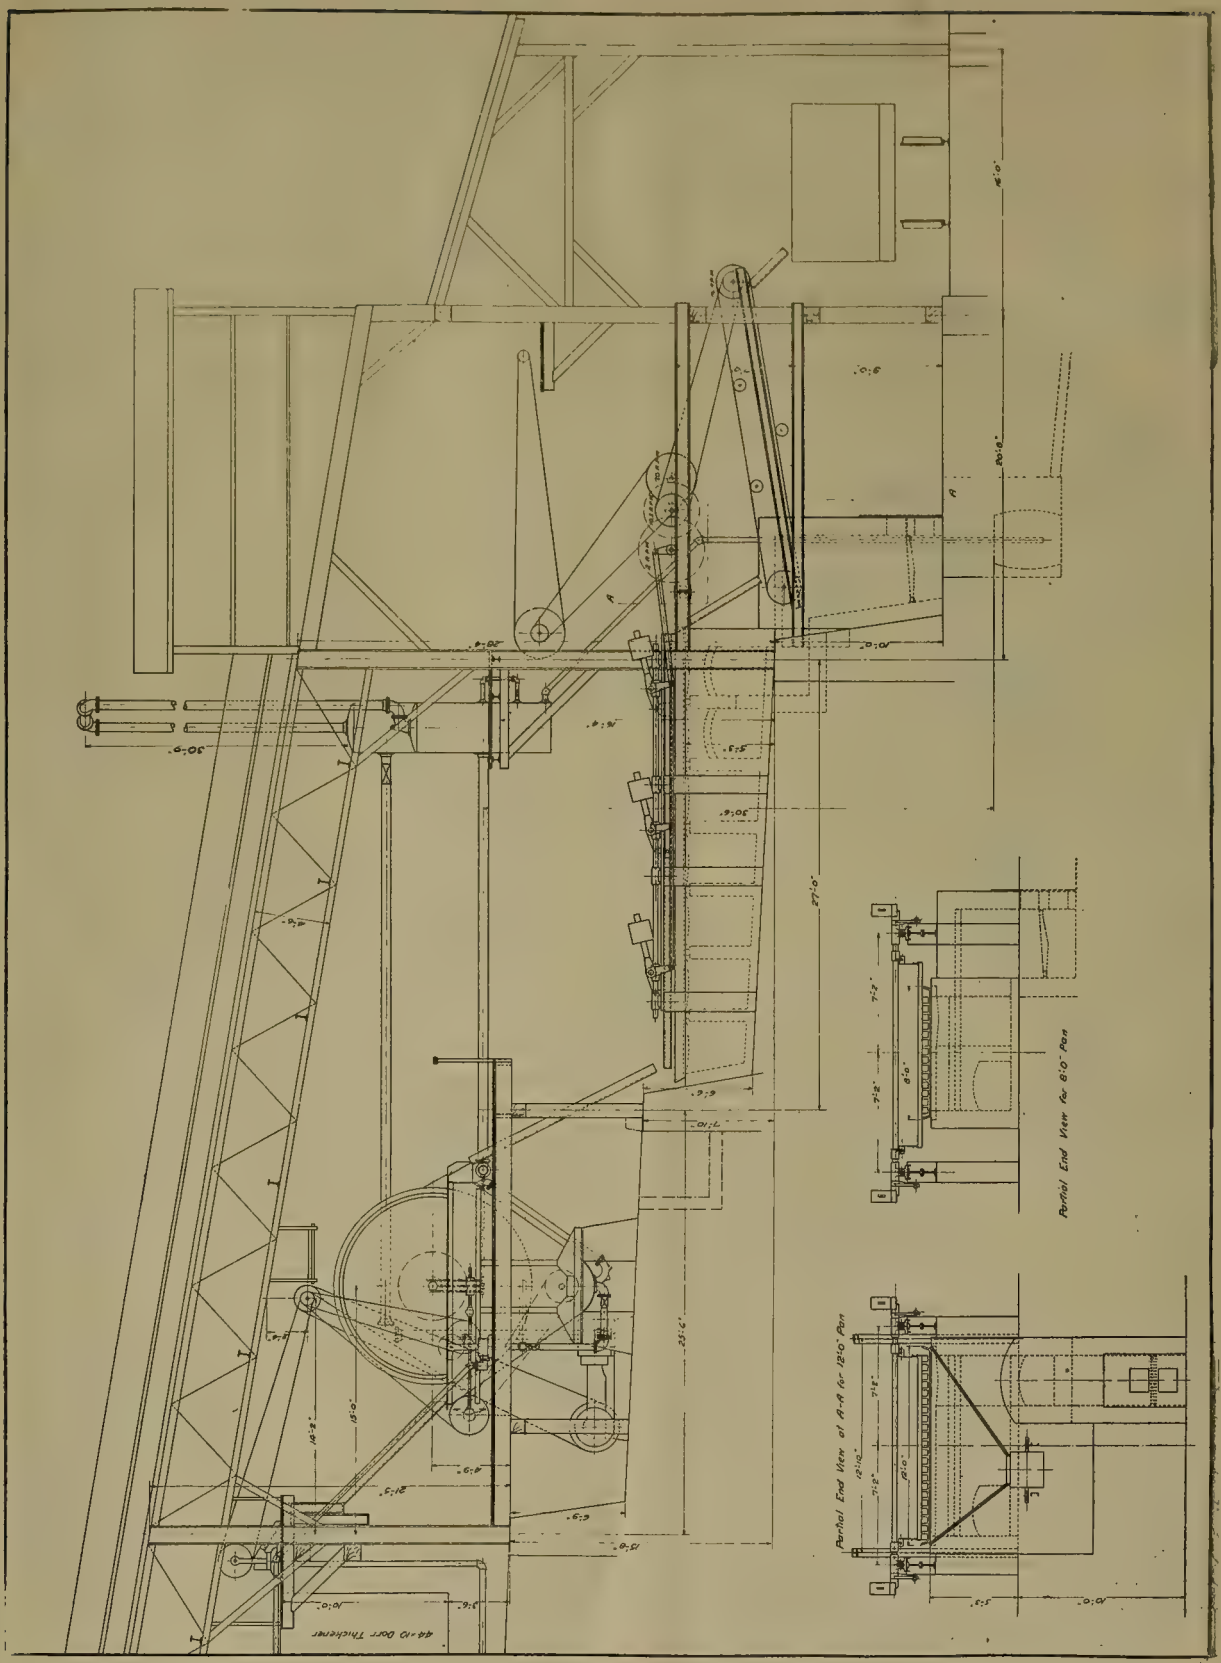


FIG. 3. THE LOWDEN DRYER, AS ARRANGED FOR THE TREATMENT OF FLOTATION CONCENTRATE

comparison, I may mention that Lake Superior covers 31,500 square miles and Lake Ontario 7250. The eastern edge of the old lake is now the granary of Utah. If the water were to rise to its former level, the Mormon temple in Salt Lake City would be submerged 850 ft. and Fort Russell would be 150 ft. below the surface. The area of

SHOWING THE EXTENT OF LAKE BONNEVILLE AS COMPARED WITH THAT OF THE EXISTING SALT LAKE

Lake Bonneville was diminished suddenly by an overflow that eroded an outlet through its rim at Red Rock pass at the north end of Cache valley. There the rim was a barrier of alluvium, instead of solid rock; the flood-water overflowed, a break was made, and a mighty river soon issued, causing a geologic debacle.

NOTES. It is interesting to note that the first contract with the American Smelting & Refining Co., for the smelting of the concentrate, called for 95% of the copper contents, as determined by wet assay; for 90% of the silver at the New York quotation; and payment for all gold contents of 0.03 oz. or over at $20 per ounce (that is, 67 cents less than its market-value). The base charge for treatment was $6 per ton, a minimum of $5.50 and a maximum of $7.50 being stipulated. At least 10% of iron over insoluble was guaranteed by the Utah Copper Company, "such excess to be considered neutral, and an allowance of 10 cents per unit for each percentage of excess over the guarantee." All insoluble in excess of iron was charged for at the rate of 10c. per unit. The charges for refining the blister copper were $30 per ton, besides a 2% allowance for loss in refining of the silver and a deduction of 13 lb. per ton for similar loss in refining of the blister copper.

In 1917 the two mills treated 12,542,000 tons at a cost of 69.3 cents per ton. The Arthur mill treated 5,464,800 tons, or an average of 14,972 tons per diem. The average grade of the ore milled at both plants was 1.337% copper and the average recovery was 61.1%, equivalent to 16.33 pounds of copper per ton of ore. In 1916 the average recovery was 62.34%, the poorer showing made in 1917 being due to unsettled operating conditions, the various improvements under way, and the lower grade of the ore. In the company's annual report, from which I get these data, it is stated that "the average normal and metallurgically economical capacity of the two plants during the year was about 24,000 tons per day, whereas in order to maintain maximum production of copper a daily average of 34,362 tons was milled." The cost of milling in 1917 was abnormal, owing to the higher costs of labor and supplies and to the large charges made for State and Federal taxes, which amounted to $4,381,205. At the Magna mill the cost was 62.28c. and at the Arthur mill it was 78.40c., as compared with 35.35 and 40.94c., respectively, in 1916.

ERRATA. In the second article of the series one or two errors and omissions were made. The later incorporation of the enterprise, in New Jersey, was made on April 29, 1904. No bonds were issued by the original company, which was registered in Colorado on June 4, 1903, for $500,000 in shares of $1 each. The present company, the New Jersey corporation, at the start issued 450,000 shares of stock at $10 per share and $750,000 worth of 7% bonds in full payment for all the assets and liabilities of the Utah Copper Company of Colorado. Colonel Wall received 20%, or $150,000, of these bonds. He also received 20% of the 450,000 shares of stock. Messrs. Cohen and Jackling received their commission in stock. The remainder of the bonds and stock went to the stockholders of the original company in order to reimburse them for the amount of money that they had paid to the vendor, Colonel Wall, and for the capital spent on the Copperton mill, as well as the development and equipment of the mine.

At the time of the incorporation of the present company, under the laws of New Jersey, the MacNeill and Penrose group held 67½% of the stock. In February 1907 Hayden, Stone & Co. underwrote the purchase of 60,000 shares of stock at $25 per share, making $1,500,000, and in January 1908 the same firm of brokers underwrote an issue of $1,500,000 of bonds convertible into stock at $20 per share, these bonds being sold in order to provide funds for expanding the capacity of the mill. Thus the capitalization of the company became augmented to $7,350,000. The working capital remaining on hand amounts to $48,293,528.

The Value of Gold in the Economic System

By HENRY STRAKOSCH

*The question has been raised as to whether any and, if so, what measure of relief should be given to the gold-mining industry. The answer must depend upon the view one holds as to the utility and value of gold to our economic system. If the view is held that gold is not necessary to that system, then mines unable to bear the stress of the situation have no more claim to relief than many industries that have suffered or gone out of existence owing to the War. The loss incurred by the owners merely forms a very small addition to the price we are paying for waging war to uphold liberty and justice in the world. If, on the other hand, it can be shown that gold is necessary to our economic system, then the question resolves itself into assessing its value to that system—as distinct from its price—and in devising a scheme that will most efficiently foster an increased production of gold.

The granting of a bounty by the Government on every ounce of gold produced in the Empire on condition that it is sold to the Government suggests itself as the best means of stimulating the production of gold and placing its control in the hands of the Government. Let us now examine what kind of bounty would tend most powerfully to stimulate the production of gold. For this purpose it is appropriate to divide the gold mines into the following three classes:

1. Developed and equipped low-grade mines that have already shut-down their operations or that are on the point of doing so owing to the increase of the cost of production.

2. Developed and equipped producing mines that have a sufficiently large percentage of high-grade ore to enable them to work these notwithstanding the increased cost.

3. Partly-developed and partly-equipped mines that, owing to the low-grade character of their ore, have been temporarily allowed to lie idle.

If the granting of a bounty were to be confined to the mines under Class 1, the effect upon the whole gold production would not be to increase it, but merely to retard its decline. If an increase in the gold production is aimed at, and in view of the needs of our currency and credit reservoir there can be little doubt about this being the right course, an increase can only be produced by stimulating production, not merely in the mines under Class 1, but under all three classes. The so-called rich mines are called rich, not because all the ore contained in them is of high grade, but because the percentage of high-grade ore is larger than in the poor mines. All three classes of mines—and especially those of the Central Rand—contain vast quantities of low-grade ore. The exploitation of these in the case of mines under Classes 2 and 3 will involve capital expenditure for additional development and milling equipment. It is obvious that such expenditure will not be incurred if there is not a reasonable prospect of it flowing back with an adequate return in the shape of profit.

A bounty, therefore, too closely circumscribed as regards its extent and duration, would not be conducive to capital expenditure being incurred. Such a bounty might, moreover, prove from its purely temporary character to be a curse in disguise, because the higher profit resulting would no doubt lead to greater demands from labor, the effects of which would probably remain long after the bounty was withdrawn. It seems, therefore, very doubtful whether a bounty extending over a short period would in the long run achieve the object desired.

The Excess Profits tax should be abolished as regards gold mines and gold-mining dividends, because of its strongly deterrent effect upon production. Gold mines are already specifically freed from colonial forms of this tax in some, if not all, of the Dominions, because the special case of gold is recognized.

To be of real use in properly stimulating the output of gold the bounty should, it is submitted, not only be of sufficient size and granted to all gold producers in the empire, but should especially be of a semi-permanent character not limited to the war period, but extending for at least 10 to 15 years after the conclusion of peace. The erection of additional plant, which will be necessary if the output of gold is desired to be increased, can hardly be expected before the War is over, and it must be assumed that it will take a matter of from two to three years from that time to complete it; so that if the bounty were fixed for a period of ten years from the declaration of peace there would only be left some seven to eight years within which to recoup the capital expenditure incurred.

To determine the size of the bounty, whether it is to be a fixed one or a variable one with a fixed minimum, and what that bounty proposed is likely to produce in the way of increasing the output of the Empire, are matters that will have to be closely investigated, but broadly speaking, the bounty should be adequate in amount so as to increase and not merely maintain the output of gold.

Let us now consider what the yearly expenditure by the nation on a gold bounty has to produce by way of benefits to the nation merely to pay for itself. For the purpose of illustration—and without in any way desiring to deal with either the extent or character of the bounty—let it be assumed that a bounty is granted of

*Excerpts from a pamphlet published in London.

12s.6d. per fine ounce of gold produced in the Empire, which is roughly equivalent to 4s. per ton of Rand ore milled, or just about equal to the increase in working-cost since July 1914. Such a bounty would involve the nation in an annual expenditure, on the basis of the 13,200,000 oz. produced in the Empire in 1917, of £8,250,000.

Take first of all the influence that an increased supply of gold has upon the value of money for purposes of Government borrowings. The £8,250,000 assumed above represents, roughly speaking, ⅛% reckoned upon the £6,500,000,000 of National Debt that will have to be funded. If the expenditure of £8,250,000 achieves no more than to reduce the market-value of credit for the purpose of Government borrowings by ⅛%, it would have paid for itself.

Applying the same reasoning to the question of foreign exchange, and basing it upon the assumption that we shall have to face for some years after the War an adverse net balance of trade of £150,000,000, the expenditure of £8,250,000 per annum would have paid for itself if it does no more than improve the value of exchanges by 5½%.

The benefits that this expenditure has to produce to pay for itself when looked upon from the point of view of cheapening credit for purposes of our commerce and industry cannot be expressed in figures, but it may safely be said that it need merely be trifling.

To base a system of bounty on gold upon the foreign-exchange position is tempting, because the price of our currency in foreign countries is the most ready means by which it can be demonstrated that by selling gold to the Bank of England at 84s.10d., the producers are not getting the full price represented by its value. It has been pointed out before that the potential value of gold rests, not merely upon its value for purposes of balancing foreign trade, but to an infinitely greater extent upon its use as a basis of our currency and credit system. It may be possible to right the foreign-exchange position with the gold that will be available in our currency reservoir after the War, but that may and probably would have the effect of so decreasing the amount of gold in the reservoir as to make the volume of credit that can be built upon it entirely insufficient for our needs. It would mean that the value of money would be raised, and probably very substantially. Recollect what happened in pre-war days. When in the autumn heavy imports of grain, cotton, etc., into this country took place from the United States, the New York exchange usually went against this country, indicating that we were not adequately balancing our trade by the export of merchandise or by receipt of revenue from the States. Consequently gold flowed out of the Bank of England to the United States. The mere prospect of this happening drove up the value of money in Lombard Street, and sometimes even induced the Bank of England to raise the bank-rate. This clearly demonstrates that to base a system of bounty upon the foreign-exchange position does not adequately meet the position, because a bounty determined upon rates of exchange takes no cognizance of the value of gold for currency and credit-creating purposes.

Before the War, and in its early stages, the foreign exchanges may be said to have truly reflected the value of gold as compared with our currency. This cannot be said today, when the ordinary commercial methods of settling our balance of trade have, more or less, been superseded by war measures, chiefly in the shape of loan operations. To illustrate this, a few figures are given. Expressed in the present New York exchange of 4.76, our currency shows a depreciation of 2%, whereas expressed in the Madrid exchange of 17.02 pesos our currency shows a depreciation of not less than 32%; on the Amsterdam exchange of 9.31, a depreciation of 23%; on the Stockholm exchange of 13.67, a depreciation of 25%; on the Copenhagen exchange of 15.31, a depreciation of 16%. It will at once be apparent that these exchanges cannot faithfully reflect the value of our currency. There can be little doubt that our adverse balance of trade with the United States today is far and away greater than that with countries such as Spain, Holland, or the Scandinavian countries. Nevertheless, the New York exchange is only 2% below par, whereas that of Spain is 32% below.

There can be little doubt that the artificiality of the exchange position will perforce have to continue for some time after the War, because it may turn out for a time to be more important to keep our currency reservoir adequately filled for the creation of credit for internal purposes than to settle our balance of trade by gold shipments.

A bounty based upon the exchange position, apart from not truly reflecting the value of gold, has another important drawback. It would be subject to violent fluctuations and to a great amount of uncertainty in regard to its duration. It would, therefore, have all the drawbacks attaching to a bounty too closely circumscribed as regards its duration and extent to which reference has been made previously, and would, therefore, not stimulate to any material extent the increased production of gold.

Few mine-owners, though they are usually speculatively inclined, will care to embark on any important capital expenditure on what would amount to a speculation in exchanges.

But the worst feature of a bounty based upon the exchange position is that it decreases in the same ratio as it proves its worth. In other words, the more the increased production of gold proves efficacious in restoring our exchanges to normal, the more is the increased production discouraged by the lowering of the bounty. If the increased production were needed merely to enable us to right the foreign exchange position, it would be right for the bounty to decrease as the exchanges improved. But the nation desires more gold not only to be able to settle its adverse net balance of trade with foreign countries, but to so fill its currency and credit reservoir as to enable credits to be built upon it which will be

adequate to meet the great requirements of our commerce and industry when we resume our peace occupations.

Those who object to the idea of a bounty because there is no precedent for it should recollect that this war is unprecedented, that the economic conditions created by it are unprecedented, and that already many things have happened on the economic field for which it will be difficult to find precedents. They should be reminded of the purchase by the Government of the Broken Hill zinc-concentrate, of the support given to the dye industry, the granting by the Government of bounties to producers of wheat, potatoes, etc., and of the differentiation in rates of interest allowed on money deposited by people in this country and by foreigners.

The question has been asked, why not, in order to do without the word 'bounty', raise the price of gold? The answer is that one of the most important attributes of gold is the fact that by common and tacit consent of the nations, its price is fixed. It is this attribute that fits it best to be a measure of value. If this idea were disturbed, gold would be robbed of one of its most valuable properties.

The raising of the price of gold would, moreover, lead to utter confusion and no doubt to a rise in prices of all commodities, with the end result that, as working costs would increase in the same proportion as the price of gold was raised, the mines would be in the same position they are in today.

Cost of Mining Supplies in Korea

The Oriental Consolidated Mining Co., an American corporation operating a large concession in Chosen, mined 303,672 tons of $5.90 gold ore during the year ended June 30, 1918, and reports the following increases in the cost of its supplies since 1914. The October output of this company was valued at $92,000. Previous monthly yields were as high as $140,000.

	Unit	Delivered 1914	Delivered 1917	Advance %	Delivered 1918	Advance over 1917 %

Labor's Share

BY AN OCCASIONAL CORRESPONDENT

Of all the problems looming large above the horizon of post-war reconstruction, the greatest of all is Labor, labor with a capital L. Without going too extensively into the dominating position attained by organized labor during the period of the War, it is no exaggeration to state that the mailed fist with one blow has been amputated from the arms of kings and kinglets and grafted upon the persons of the labor leaders.

The vast power wielded by them is exercised in different ways in different countries, with practically the same result in each case. Russia is in a state of pitiful chaos through the ascendency of the Bolsheviki, the radicals of radicals. In Germany, the Spartacus group which corresponds in principle with the Russian Bolsheviki, is struggling with the less irresponsible Socialists. In our own country, the Industrial Workers of the World, the American Bolsheviki, have become the representatives of the malcontents and failures, who, apparently would wreck the whole industrial fabric of the Nation, from which, in some miraculous way, another nation is to rise in fullfilment of a Utopian dream of no work and high pay.

The Union labor leaders are as bitterly opposed to the I. W. W. as the capitalists, and have steadfastly refused to espouse any of their doctrines. They seem content to take advantage of any opportunity to send wages kiting skyward, and work-periods sliding downward, apparently without thought for the morrow, when war-buying without regard to price will cease, and competitive conditions will again force a scrutiny of cost-sheets.

The fundamental difference between military and civil construction lies in the fact that with the former, time is the paramount consideration; with the latter, cost. During the War, the first consideration was fulfilled with signal success. The feats of the shipyards were chronicled daily; astounding numbers of rivets were driven by specially selected crews; hulls were launched in days instead of months, and people subscribed for Liberty Bonds in terms of billions of dollars, in order that the bill might be paid.

Contrary to the general impression, these remarkable speed-records were not accomplished as much by any speeding-up process on the part of individual workmen, as by multiplying the number of workmen and machine-tools many times over. A one-man job became a four or five-man job, and so on. Countless men from occupations remote from shipbuilding or munition manufacture left their barber-chairs or soda-water fountains, and, camouflaged as riveters, rushed to the shipyards for their dollar an hour, and double pay for over-time. If the high wage-rate was not enough, the famous 'work-or-fight' order of the Provost Marshal General provided the additional incentive. The exodus was general. And, now what?

War orders are being cancelled right and left. Instructions have gone forth to the shipyards stopping over-time with its double pay. Three million American soldiers and sailors will soon be demobilized, and drift back in search of their former occupations. Mr. Gompers has served notice upon the Bourbons that any attempt to secure a return to the wages and time-scales prevailing before the War would be fought by all the powers of resistance possessed by organized labor. 'To have and to hold' is the program.

There is one little detail that seems to have been overlooked in the desire to have Labor's four fat years continue indefinitely, and that is, before a mechanic can be given his five, six, or eight dollars for putting in eight hours at a shipyard, someone must sell his output for that day not merely for five, six, or eight dollars, but for enough in addition to pay for the material he uses, the overhead charges, and a return on capital besides, and do this in competition with the whole world. This is the point that is knotting the brow and graying the hair of the business-man and factory-owner.

Americans, in the past, have been the pampered people of the world. Blessed with every conceivable natural resource within their own borders, nothing was easier than to tackle their development, and let the outside world go hang. Foreign competition from the so-called 'pauper' labor of Europe was shut out by a sizable tariff-wall, behind which everybody grew and throve amazingly. Factory extensions were made to keep pace with development and a nice industrial balance was preserved. Scant attention was paid to foreign markets. We were too busy at home to bother, so Germany gobbled the South American business, Japan the Orient, England and France the remainder.

Then came the War. Factory capacities were doubled, trebled, and even quintupled, while new plants sprang up in a night. Mark Sullivan, editor of 'Collier's', says that our shipbuilding plant now has a capacity many times that of England. Who will buy the output of this great industrial equipment at prices based upon our present wage-scale, and an artificially limited output per workman?

A factory near-by retained the services of an efficiency engineer. In one of his tours of inspection, he noticed a certain forging in which it was the custom to drill the rivet-holes in place with pneumatic drills. It was a slow and expensive job. Accordingly, he made drilling templates, erected a radial drill-press in a convenient corner of the shop, and cut the time for drilling nearly 75%. A few days after inaugurating this reform, to his astonish-

ment he found that the drilling crew had returned to the old method. With fire in his eye, he tackled the foreman, and elicited this answer, "To hell with this efficiency stuff; we'll do as we please." The efficiency engineer has resigned.

Whether we like it or not, the workman has been taught to give as little as possible for as much as he can get. Through the policy of limiting the number of apprentices, opportunity to learn a useful trade is denied many of our young men. A workman who speeds up his work is made to feel morally and physically that to persist in such a course will, to say the least, be inadvisable. Expensive machine-tools and labor-saving devices are in operation a disappointingly short proportion of the working-day. Any pretext to shut-down is resorted to, in order to make the job last as long as possible. Groups of idle men are conspicuous around the yards, engaged in conversation and exchanging amenities remote from the conduct of the job in hand. Discipline is disregarded.

A group of laborers, working at an excavation for the foundations for a new shipyard, were the object of the scrutiny of a foreman, who watched in silence the homeopathic doses of dirt that soiled the business end of the shovels, until he could stand it no longer. Waxing sarcastic, he said, "Would you mind putting a little more zip into that shoveling?" The entire group threw down their shovels and quit. One of the men said, "We don't allow nobody to talk to us like that."

When there were two or three jobs for every available man, and at wages in proportion to the law of supply and demand, it was quite a fad to work three or four days for one employer, then quit, loaf the rest of the week, and then get another job elsewhere. Why not? Why kill oneself working when enough to live on can be made by working half-time? But, watch what happens when the whistle blows for quitting time. Instantly the crew becomes electrified into action; in other words, all hands 'beat it', while the going is good, and hundreds of impromptu Marathons are staged between the yard and the great gates which vomit forth the toiler. It is an interesting, instructive, and, in a way, a mournful spectacle.

Of course, it is easy to express an opinion, in terse language, on this kind of spirit, and to jump at the conclusion that it is typical of all workmen; but it doesn't do an atom of good, and only serves to widen the breach between employee and employer. There can be no denial that labor and capital, employee and employer, are drifting farther apart all the time; the problem is to find a remedy whereby the industrial fabric of the nation may be saved from the rocks toward which it seems to be drifting.

Charles M. Schwab said a few months ago that, from now on, the workmen would run the world. He qualified this remark later by explaining that he meant workmen in a broad sense, and not necessarily union workmen. Mr. Schwab has demonstrated his ability and breadth of vision many times, and it will be well for both employers and employees to heed his words and provide ways and means of meeting the situation. Little by little employers have tried many more or less half-hearted measures for meeting the demands of labor, but these measures, bonuses, piece-work, and the like, were merely stop-gaps, and have failed to satisfy the desires of the men.

The objection raised by workmen to piece-work, is that the high record of today is often made the mean basis for tomorrow's wage computation, and that the workman is driven to death by constantly increasing exactions on the part of the employer. The giving of a bonus conveys the impression of a gratuity, a charity on the part of the employer, an act of patronage from master to man, which does not sit well on the independent character of the American workmen. Back of it all lies the fact that the workman is a rank outsider. The inner affairs in the administration of the business are barred from him; he is not informed on the multifarious administrative, financial, and sales problems. When work is slack, he is 'laid off' without ceremony. When work is plentiful, he is hired in droves, not as an individual but as a commodity; in short, not one blessed thing is done for the development of morale among the workmen, nothing to differentiate between him and the cattle in the field. The larger the establishment, the more acute this shutting-out process becomes. He looks with suspicion, not to say disbelief, upon any pronunciamento issuing from employers or associations of employers. Stories of losses on contracts, inability to meet increased wage exactions and avoid bankruptcy, and similar wails of anguish are laughed to scorn. First it was a 10-hour work-day, then a nine, an eight, now a 44-hour week, while the I. W. W. talked about a 6-hour day before they were unceremoniously rounded up and deported by the mine-owners at Bisbee. The whole system is unreasoning, unscientific, and in the end destructive of industry.

There is a remedy somewhere; suppose, for instance, that in attempting to solve the problem, one were to start with the two elements, labor and capital, and attempt their fusion into a homogeneous union for their mutual well-being. It is admitted that each is entitled to compensation that will be fair to both: for capital a rate of interest return that will reasonably represent the character of the investment; for labor, a wage that will afford a reasonable surplus over and above the cost of living to provide in modest measure the comforts and pleasure without which life is a dreary drudgery. So far, so good. Now for the meat of the whole thing.

Effect a series of organizations within the parent organization, making each department an organization within itself. These internal organizations may be divided into a suitable number of shares without par value, but permitting each share to participate in the profits of that department in proportion to the number of shares issued. These profit-sharing shares are to be the property of the workman during the period of his employment only, and are to revert to the organization for reissue in the event of his leaving his employment for any reason.

A Board of Direction is to be formed composed of one

representative from each department selected by the workmen of that department. This Board is to meet at regular intervals for the consideration and discussion of all matters of business, external and internal, effecting the welfare of the business. It is essential that the workmen shall be taken into full confidence. In no other way can they be made to feel that they actually are an integral part of the business, sharing with the management the full responsibilty for its success or failure.

Cost-keeping has become a science. Detailed estimates are always prepared showing the extent of the participation and estimated cost of the work done by each department in the execution of every contract. Thus the estimated profit is known, and can be allotted in proportion to the work done by and to each department. When the job is finished, reports can be submitted to the Board showing which department has failed to earn its quota, and which has done better than its quota. The actual profit earned by each department on each job can be assigned to it for dividend purposes after the wage to labor and the interest to capital have been paid. Surplus earnings over labor's wage and capital's interest can be split equally between the workman and the company stockholders.

In this way, only those who earn will participate in the profits. The dividends to workmen, according to this scheme, will not be distributed indiscriminately, but will go only to the department that has earned them. The delegates from the shops to the Board of Direction will be in full possession of all the facts, figures, and statistics at all times. They, as representatives of the workmen, will act for them, keep them in possession of all facts concerning the conduct of the business, in short, will prevent their being hocus-pocused through juggling of figures, or any other form of dishonesty.

Shop discipline will be largely in the hands of the men themselves. The shop representative on the Board will have a voice in designating the men to be laid off in slack times. The men, feeling a direct personal interest in the success of the enterprise, owing their sharing directly in the profits of their own labor, may be trusted to select their own foremen, who would, preferably at the same time, be their delegate to the Board of Direction. Inter-shop disputes and delays in transmittal of material from one department to the other would be under the supervision of the superintendent or manager. Liaison in factory administration, as in the operation of various sections of an army, is essential.

In the working out of this scheme, capital gets a little the worse of it. When times are bad, and work is slack, capital gets nothing, while the workman still gets his wage. This, however, is inevitable, as a living wage is essential to the workman, while capital generally represents the combined surplus of many people, and outside the widows and orphans of whom stock inflators are so fond of talking, most capitalists manage to eke out a precarious livelihood no matter how hard the times, or how scarce the dividends.

In general, what has been attempted to outline in a sketchy way here is merely the skeleton of an idea of making labor and capital one instead of two. The long-haired phrase-maker who descants upon the iniquity of capital and the glory of labor probably never did a square day's work in his collective life. The politician who panders to all that is bad in trade-unionism for the sake of votes is even worse. Labor itself should give a thought to the morrow, as should the capitalist, the factory-owner, and the business-man. This scheme is not offered as a substitute for trade-unionism, but is a plan to make a self-respecting citizen of the workman, a citizen who will share the responsibilities of life with his fellow-man, a man to whom sabotage will be abhorrent, who will participate in fair proportion in the profits of his own labor, who by this means can see not merely a decent living as his portion but an opportunity for the accumulation of a reasonable surplus against the day when old age shall overtake him, and he will be unable to work any longer.

The walking delegate won't like this scheme, however, He will have no choice but to go to work. The socialist will be out of a job, until he can devise a plan to give the workman all the profits and the capitalist none at all. Anyway, the goose that has been laying all the golden eggs during the last four years is nearly played out. Prices are coming down. Competitive conditions are returning. The product of our factories, increased many fold in volume, will soon have to be sold at prices that will compete with those of other nations.

A lot of eminent gentlemen are about to sit around a table at Versailles. Why not start a little peace-table of your own, and see if you can't do something to ward off a smash?

Electrolytic Zinc in Australia

The Electrolytic Company of Australia, operating in Tasmania, has the first unit of its plant running continuously. Over 90 tons of high-grade zinc is being produced weekly. Results have proved definitely that the project is a commercial one and thoroughly sound. Plans for a larger scheme, embracing the treatment of approximately 250 tons of zinc concentrate per day, to yield 100 tons of electrolytic metal, are now under consideration. At the request of the hydro-electric department of the Government of Tasmania, the company has indicated its willingness to take a second block of 26,000 hp. in two sections of 11,000 and 15,000 hp., respectively. The hydro-electric department states that the first block of 11,0000 hp. will be available in about 18 months, and the remainder of 15,000 hp. at a later date. Investigations have proceeded further and with satisfactory results in regard to the establishment of several allied industries. Some of these will involve the allocation of the third block of power. Amalgamated Zinc (De Bavay's), of Broken Hill, controls this company. During its last financial half-year, the flotation of 164,719 tons of old tailing recovered 47,184 tons of concentrate assaying 48.2% zinc, 6.4% lead, and 9.1 oz. silver per ton.

REVIEW OF MINING

MONTERREY, MEXICO

Review of the Railroad Situation in the Republic.

Renewal of revolutionary disturbances has caused another suspension of operations of several divisions of the National Railways of Mexico. The trouble is confined chiefly to the States of Chihuahua and Durango. No through trains are running between El Paso and Torreon. Interruptions of traffic on the line between Eagle Pass to Torreon are also reported. Tranquility prevails along the route of the main line of the National Railways all the way between Laredo and the City of Mexico, as well as in the territory traversed by the Monterrey-Matamoros, the Monterrey-Torreon, and the Saltillo-Torreon divisions. Through sleeping-car service is maintained between Laredo and the City of Mexico. Mining and other industrial conditions in the State of Chihuahua continue to be seriously affected by the depredations of roving bands of revolutionists, all claiming to be a part of the so-called army of Francisco Villa. During the past few weeks Villa has been making desperate efforts to reach some border point. It is said that he has in his possession an enormous store of silver bullion which he 'confiscated' from various mines within the scope of his operations. He is anxious to dispose of the precious metal to agents on the American side of the Rio Grande, and he cannot well do this unless he obtains control of a 'port of entry.' His border objective is believed to be Ojinaga, situated opposite Presidio, Texas. According to current report in mining circles, the value of the bullion that Villa is now carrying about is more than one-half million dollars. One of the reasons that he is so anxious to turn it into money as soon as possible is that his wife, who is living in San Antonio, is in almost destitute condition. Villa wants to provide her with funds to relieve her from her distress.

In the Pacific coast region of Mexico, along the line of the Southern Pacific, business and industrial conditions show a big revival. Much attention is being given to the construction of large systems of irrigation in the valleys of the Fuerte, Sinaloa, Mayo, and various other rivers. The coastal belt for 600 miles bordering the Pacific is splendidly watered with running streams, which afford ample supply for irrigating many million acres of land. Sugar-cane is already extensively grown, and it is planned by some of the larger planters to grow cotton on a considerable scale. Upon the slopes of the mountains running down to the coastal country some coffee is raised. In one part of Durango, more than 100 miles from the nearest railroad, wild coffee is found in great abundance. The berries are small, but the flavor is said to be delicious. The bushes cover the mountain-sides in great profusion, and their annual crop of coffee is the source of supply for thousands of natives.

It was not until the Southern Pacific Railroad of Mexico

was constructed down the coast from Guaymas that a transportation outlet for the rich agricultural and mineral region was obtained. When the Madero revolution was begun in the late fall of 1910, the railroad had reached the picturesque tropical town of Tepic, about 800 miles southeast of Guaymas. Grading was in progress on the division that was to run between Tepic and Orendain, the latter point being 25 miles west of Guadalajara. This construction work was stopped, and has not as yet been resumed. It was the original plan for the coast line of the Southern Pacific to run all the way from Guaymas to Salina Cruz, where it would have connected with the National Tehauntepec railroad. From Tepic to Salina Cruz is 1100 miles. That part of Western Mexico is as yet wholly lacking in railroads. It is a region of vast undeveloped riches. But for the revolutionary troubles it is believed that the Southern Pacific would have added by now more than 1500 miles to its railroad system in Mexico. Even during the long period of vicisitudes that it has gone through, its intermittent operation has brought great industrial benefit to the ports and towns along its route. The line crosses the Kansas City, Mexico & Orient's Pacific division at San Blas, and is thus given access to the port of Topolobampo. In this connection it is interesting to mention that Topolobampo is chiefly noted for being the site of an American colony of socialists that was established there more than 30 years ago. They prospered for a time, but in a few years it lost its identity as a colony. Descendants of some of the original settlers are still living there. Altata and Mazatlan are two other Pacific ports that are given rail outlets by means of the Southern Pacific. If the line should be extended to Salina Cruz it would touch at Acapulco, which has long been one of the principal but most isolated ports on the West coast of Mexico. During the administration of the late president Porfirio Diaz, the port and harbor of Salina Cruz were improved at a cost of several million dollars. In the days before the Panama Canal it was a busy place, being the Pacific terminus of the National Tehauntepec railroad. It has fallen into a neglected state that calls for repairs in order to make it properly serviceable.

One of the significant features of the railroad situation in Mexico so far as improvements being made to existing lines or the construction of new roads by the Government is concerned, is that nothing of this kind can be done without foreign financial assistance. This help must come from the United States. From time to time during the past year, semi-official reports have been issued from the City of Mexico that the Carranza government was preparing to commence extensive railroad building and repairing of existing lines. Practically no work of this kind has as yet been done, for the simple reason that money for the purpose has not been obtainable. It is deemed probable that if the Mexican government shows the right sort of attitude and encouragement to American investors several railroad projects, the urgency of which is quite apparent, will be carried out in the near future. One of these proposed lines is to run from Tampico north along the Gulf coast to Matamoros, opposite Brownsville, Texas, a distance of about 325 miles. The route is through one of the richest and most undeveloped parts of Mexico. Besides the oil potentialities of the region, it is capable of producing a great variety of crops. Direct rail connection of Tampico with the City of Mexico is also proposed. This road was started several years ago and more than 100 miles of the grade was constructed.

The Nacozari Consolidated company is reported to have acquired the Tharis York copper property adjoining. The new owner operates a silver-lead mine. Its main adit is in 2500 ft. and can now be extended through the Tharis.

Greene-Cananea produced 5,100,000 lb. of copper and 169,560 oz. of silver during November. This is the largest output for 1918, and 800,000 lb. above October.

LEAD, SOUTH DAKOTA

New Work in the Black Hills Region.

Lead.—In order to conserve power, the Homestake company has purchased two Ingersoll-Rand direct-connected electrically-driven compressors. They will each have a capacity of 4500 cu. ft. of air per minute. One is being erected at the B and M shaft; the other at the Ellison shaft. The large compressor now in use at the Ellison has a capacity of 7500 cu. ft. This, together with compressors now in use, gives a capacity not needed at all times, and the additions are being made to conserve power. The Brig and Golden Gate hoists are now electrically operated.

The labor situation has been relieved, and it is expected that the stamps in the Golden Star mill will be dropping again soon after January 1.

The Mineral Point mill is still out of commission, but it is expected that this plant will be at work early in the new year.

Hill City.—The American Tin & Tungsten Co. continues work at both the Mohawk and Cowboy mines. At the former, sinking is in progress; at the Cowboy ore is being broken on the 300-ft. level. A good deal of ore has been broken, and this will be hoisted and delivered to the mill as soon as the plant is ready. A 60-hp. hoist is being erected at the Cowboy to handle a one-ton skip. The ore will be hauled from the mine to rail by an Acme five-ton truck and delivered to the mill-bins in railroad cars. Before working the plant on tin ore, the following new equipment will be added: Telsmith gyratory crusher, Hardinge ball-mill, three Richards pulsator classifiers, Deister plato slime-table, and an electric-furnace for smelting concentrate. It is expected to have the new installations completed by March 1, when the plant will resume dressing tin ore. A saving of both cassiterite and mica will be made. Ralph A. Meyers is manager.

The shaft at the First National has been unwatered and the mine is being examined by engineers from Michigan. The property is equipped with a 10-stamp mill, and it is proposed that work will be resumed early in 1919.

Regular shipments of copper are being made by the Maloney Blue Lead Co., near Sheridan. A boiler and compressor have been put in.

Keystone.—A. T. Roos and associates have leased the Bob Ingersoll mine, and are making regular shipments of columbite-tantalite to the Eastern market. Amblygonite is also being extracted. This will be shipped as soon as a market is found.

Custer.—The Rare Minerals Co. is hurrying construction of its concentrator, expected to be ready early in 1919. Tin ore is being mined at the Hebert mine near Oroville, and this will be shipped to the mill for treatment. In addition, ore will be taken from properties in the vicinity of Custer.

The Old Mike mica mine near Berne, which has been making regular shipments, has been sold to Idaho people who are making arrangements to continue work. The new owners will organize under the name of the Berne Mica Corporation, and will enlarge operations.

The concentrator of the Spokane Lead & Silver Co. continues to produce lead-silver concentrate. This is hauled to rail at Keystone in trucks and shipped to smelters.

Ardmore.—The Refinite company has temporarily suspended work awaiting arrival of a new dryer of special design. It will increase the output of the product, which is used in softening water. The plant has proved a success and there is a demand for the product. The impure kaolin is dried, crushed, and pressed, followed by drying in steam-heated chambers and direct flame-dryer. After this is completed the product is ready for specially-designed filters, in which it is used to remove the hard properties of water.

PLATTEVILLE, WISCONSIN

Zinc, Lead, and Pyrite Conditions in November.

Unsettled conditions in the market for second-grade zinc ores during the latter half of November, coupled with serious inroads by influenza, aided materially to reduce output of the various fields. The end of the War contributed not a little to disorganize working forces from the 7th to the 15th. Thanksgiving was taken advantage of more liberally this year for time off than in former years, and operators were none too diligent in refusing this, as markets at about that time slumped decidedly and smaller outputs were welcomed. Labor conditions showed some improvement toward the end of the month, especially in the southern parts of the field, where forces were restored sufficiently to renew unbroken shifts. Men began returning from the camps, and labor-gangs from the large commercial centres began to trickle in. War-time prices for zinc ore, leading operators agreed, could no longer be expected, but it was argued that the end of the War should mean quickly lowered costs for powder, steel, and supplies. The high cost of living, it was pointed out, made it impossible to even suggest a reduction in wages, and a demand for reduction in the price of supplies it is believed will become insistent or else a curtailed output, and reduced working forces will be the plan operators will be compelled to pursue. Little reserve ore was used up in November, and close estimates made at the end of the month accounted for 7500 tons of zinc concentrate of all grades in bin.

High-grade refinery ore for sheet makers fared better. Lead ore prices held up well, sales totaling 1000 tons. A fair reserve was carried over into December. Shipments of pyrite were light. The two Government sulphuric-acid works being erected were shut-down. Deliveries totaled 14,269 tons of zinc ore, 976 tons of lead, and 1299 tons of pyrite.

VICTORIA, BRITISH COLUMBIA

General Mining News of the Province.

It is interesting to trace, by means of the records of applications for leases on the different placer grounds of British Columbia, the effect of the market demand and general conditions during the last several years. In 1915, prices had not risen to the height that they reached later during the War, and the labor problem was not as serious, with the result that the mining of the placer areas of the Province proceeded much as usual, about 160 leases being issued during twelve months. In 1916, with base metals, etc., at high prices, dearth of labor, and high costs, the number of applications for placers were reduced to 87. But in 1917, although the same conditions obtained, the demand and high price for platinum, which is found in many of the placers, once more fired the enthusiasm of prospectors and others, resulting in the issuance by the Department of Mines of 139 leases. The total for 1918 will show that the interest was maintained, as it will reach approximately 137 leases. Of the latter, 35 bench leases and 9 dredging leases were granted during October and November.

Hazelton.—A car of molybdenite was shipped from the Hazelton View mine during the past winter. Two tunnels are being driven, development to continue during the next few months.

Dalby B. Morkill, mine superintendent of the New Hazelton Gold Cobalt Co., a Vancouver corporation owning a group of claims on Rocher de Boule mountain, is satisfied with results of development. Two tunnels are being driven. One of these is on the Victoria gold-cobalt-molybdenum vein at a point 1100 ft. vertically below the apex, and 350 ft. below the main tunnel.

Vancouver.—A depth of 625 ft. has been reached by the drill that is being put down for oil in the Burnaby district near here by the Spartan Oil Co. Indications are said to be promising, and oil is expected to be struck at 1000 feet.

Princeton.—After an inspection of the Copper Mountain plant of the Canada Copper Corporation, G. O. Bradley, of Bradley, Bruff & Labarthe, has returned to San Francisco. He reports that satisfactory progress is being made in erecting the 2000-ton plant. The 100-mile power-line of the West Kootenay Power & Light Co. probably will be completed to the property some time next summer.

Rossland.—Ernest Levy, general manager of Le Roi No. 2 (Josie), states that the mine produced in the year ended September 30 last, 19,000 tons of ore.

Phoenix.—That the Phoenix mines should be prospected by diamond-drill with a view to proving the existence of ore for operation of the now idle Greenwood smelter is a suggestion made by residents of the district. It is said that the Provincial government is to be asked to extend financial aid to permit starting of this work. The Hon. J. D. MacLean, Provincial secretary and member of Parliament for Greenwood, and J. E. Thompson, member for Grand Forks, are said to be in sympathy with the proposal, and are ready to render support. Through Oscar Lachmund, former general manager for the Canada Copper Corporation, commercial interests of Greenwood determined that the smelter shall not remain inactive, have asked the company to lease the plant for $10,000 per year in order that the citizens' company may operate it. The company's directors at New York are said to have these and other suggestions under consideration.

Prince Rupert.—With the revival of mining in the Portland Canal district this town has commenced an agitation for the local establishment of a smelter, to enable many contiguous properties to be operated.

Barkerville.—Discussing the season's operations in the Cariboo district, Henry Boursin, a well known mining man, makes the following statements: "The output from the hydraulic mines this year was less than that of last owing to a shorter water season and scarcity of labor... The clean-up of the Stout's Gulch mine was more than usual, due to the discovery of another channel of pay-gravel. Stout's gulch is a small stream just above Barkerville. The yield of gold from the gulch, first by driving and later by hydraulic, amounts to $2,500,000. The width of hydraulic pay, more than 600 ft., is extraordinary for such a small stream.——C. W. Moore, acting for American capital, has bought the locally-owned Waverly hydraulic mine on Grouse creek, four miles from Barkerville. Although the Waverly is one of the oldest hydraulic properties in the Province, it doubtless contains more gold than has been washed out of it, as the head of the sluice-flume is 30 ft. above the bottom of the pay-gravel in the main channel, and the gravel below the flume is known to be rich.——F. J. Tregillus, T. A. Blair, and Pat Carey are sinking a shaft on the 9-ft. gold-bearing vein in their Warspite claim four miles from Barkerville. At the present depth, 14 ft., the shaft discloses an excellent showing of visible gold, while the rock in which no gold can be seen shows a nice string of flour-gold when mortared and panned. The vein on which this work is being done has been exposed at intervals by trenching and open-cuts a length of more than 8000 ft., and is believed to be the 'mother lode' from which the $20,000,000 placer of Williams creek and the $2,500,000 placer of Grouse creek have their origin. The creeks mentioned drain the western and eastern slopes respectively of Proserpine mountain, and the strike of the vein closely approximates the up-stream limit of rich placer on each creek.——The Lightning Creek Gold Gravels Co. is drilling with a Keystone on Lightning at Wingdam. This company was promoted by C. H. Unverzagt of New York, and last summer an agent of the United States government was sent to the property to see how conditions tallied with advertisements."

ARIZONA

Jerome.—United Verde Extension pays 75c. per share on February 1. This amounts to $787,500.

The Shea Copper Co. has made its first shipment of ore to the United Verde Extension smelter. The ore contained over 9% copper, besides gold, silver, and an appreciable amount of antimony. The ore is coming chiefly from the 325-ft. level.

Kingman.—The Leviathan mine and mill, a molybdenite producer, have suspended operation for the time. This company ships its concentrate to Los Angeles for treatment.

The Walkover mine is being unwatered.

The Emerald Isle Copper Company recently made a shipment of 4500 lb. of cathode copper to San Francisco. This electrolytic plant is now turning out 2500 lb. daily. Carload shipments will be made hereafter. Preparations for opening a glory-hole are under way, and present work indicates 200,000 tons of 3% ore.

Ray.—Considerable mixed litigation has been started over the Ray silver-lead mines, three miles from Ray, a property mainly owned in Tucson, under lease to C. E. Addams, former manager of the Ray Hercules mine. The lease is said to have been clearing $15,000 per month, divided equally between Addams and the company, which before the leasing period is said to have made little profit. The ore has to be packed on mules to Ray, for rail shipment to El Paso. Locally there is a suit by W. W. Lawhon, a mining broker, who asks a share in the contract alleged to have been made for the lease by Jim Pollard, former superintendent of the property, with whom he alleges he was a partner. Pollard assumed to have some share in the profits of the lease, other than those that come to him as a stockholder in the corporation. Another suit is that filed in New York by F. C. Armstrong, president of the Ray Hercules company, who alleges that Addams secured the lease at a time when he was in Armstrong's employ and when all his services and the profits therefrom were Armstrong's due.

Superior.—Magma Copper pays 50c. per share, equal to $120,000, on January 6.

Tucson.—It has been announced by the south-western representative of the American Smelting & Refining Co., in answer to recent rumors, that it is impossible to state at present whether the Sasco smelter at Silverbell will continue operations or not. Only one furnace is in blast at present, it being impossible to get more ore. The mine at Silverbell is producing 9000 tons per month. It is too low grade to stand shipment to Hayden in the event of the smelter being closed.

In the recent decision of the Superior Court, the Stratton claims in the Old Hat district, held by the receiver of the Stratton Copper Co., reverted to Stratton, the owner. The Daily Arizona Consolidated Copper Co. immediately exercised its option and purchased three of the claims. Other claims are to be sold to the Wilson interests. The Daily Arizona has let a contract for development to Copeland brothers.

Walker.—The Black Diamond Mining & Development Co. has completed erection of an Ingersoll-Rand compressor with jack-hammers. The manager, C. N. Brown, states that everything is running smoothly and a mill is contemplated soon. Sinking continues at 250 ft. depth.

The Homestead mine was closed for a week awaiting engine parts. The manager, John Harlan, reports resumption of mining in a breast of hard rock encountered in north cross-cut.

The North Capital claim, owned by J. I. Gardner of Prescott, has been bonded to Crank, Ashton, and Comer, who are opening a cross-vein. Shipping ore was cut at 40 ft., principally lead bearing.

Johnson & Strom, lessees at the Eureka, shipped a car to Humboldt netting $55 per ton.

J. Hayes has bonded the Hidden Treasure claim and will start extending an old tunnel. Regular shipments of pyrite for fluxing will be made to Humboldt. The ore also contains gold and silver.

CALIFORNIA

Press dispatches from Washington on December 18 state that Van H. Manning, director of the U. S. Bureau of Mines, on the solicitation of Representative Kahn, has agreed to recommend to Congress the establishment of a mine-rescue station in California. The new station will be either at San Francisco, Berkeley, or some other suitable point. An annual appropriation of $17,600 will be necessary.

Bulletin 161, Law Serial 13, by J. W. Thompson of the U. S. Bureau of Mines, Washington, D. C., contains all Californian mining laws, with amendments. Included are actions relating to mining claims, eminent domain, employer's liability act, hours of labor, miners' licenses, liens, and wages, mineral lands and mines, State Mining Bureau, mining corporations, mining debris, oil and gas, taxation, water-rights, and explosives.

Hammonton.—Yuba Consolidated, during the year ended February 28, 1918, according to the annual report of the Consolidated Gold Fields of South Africa, just issued, recovered gold worth $2,849,220. This is equal to 18.42c. per cu. yd. on 15,468,000 yards dredged. Expenses were $758,529, equal to 4.90c., leaving a profit of $2,090,691, or 13.52c. per yard. In the four months—March to June, inclusive—the average yield was 18.3c., expenses 6.68c., and net operating profit $584,351.

Igo.—The Crystal mine, a silver property near Igo, has been re-opened by A. N. Kingsbury, who already has made a carload shipment to the smelter at Kennett. The mine was shut-down some years ago. It was once sold for $25,000, but it has been closed for 30 years. Kingsbury is satisfied he can make the mine pay. This is the only silver mine in Shasta, and one of the few in the State.

COLORADO

Breckenridge.—The French Gulch company completed its dredging season at the end of November. The final shipment of gold was worth $20,000. The 3-cu. ft. boat is now being overhauled, ready to commence in the spring. W. F. Sears is in charge.

IDAHO

Adair.—The Richmond M. M. & R. Co.'s smelter returns for November were $13,299. Operations cost $4000, plus

$1000 for the annual State tax on net earnings. Ore carries 6 to 7% copper. Development is generally satisfactory. B. N. Sharp is manager.

Boise.—According to Robert N. Bell, State inspector of mines, the Idaho mineral output during 1918 will show a decrease of 20% when compared with 1917. In the Coeur d'Alene, which contributes 90% of the State's production, there has been a great shortage of labor. But this should soon be rectified by the release of men by the Government. In central Idaho is a vast mineralized area practically untouched, due to its isolation. Road construction is necessary for this region.

Kellogg.—Bunker Hill & Sullivan distributed $4.75 per share during 1918. This is equal to $1,553,250, and makes $22,086,750 to date.

Caledonia Mining Co. will pay 1c. per share, equal to $26,050, on January 6. Previous distributions were 3c. per share. The total now is $3,699,100.

Mullan.—The Idaho-Carbonate mine has been closed until spring on account of the labor situation. During the past year the 2-compartment shaft was sunk 440 ft. from the tunnel-level. The mineralized zone on the 400-ft. level is to be prospected.

The Copper King M. & S. Co. is to be financed by selling 500,000 shares at 10c. each. This would realize $50,000, half to be spent on a 50-ton mill and half on development.

Porthill.—According to A. Klockman, general manager of the Idaho-Continental mine, ore-reserves above No. 4 tunnel are now 250,000 tons, compared with 144,000 tons in July 1917. There shoots have been followed for a total of 1800 ft. Awaiting shipment is 1600 tons of $100 lead-silver concentrate. The water-supply is being improved. About 200 men are employed, the only shortage being machinemen.

Wallace.—At a depth of 1000 ft. in the Amazon-Manhattan the orebody has been followed for 1100 ft. Two levels above have also opened the same vein. The ore carries zinc and lead, also silver.

MICHIGAN

Houghton.—Every mine in the copper country, excepting two, has all the trammers than can be employed. The labor situation has not changed so quickly that the mines are filled again, but the influx of common labor to the Lake Superior district has been rapid in the past six months. The great need for trammers has been filled. For a year past there was no difficulty at any of the mines in securing all of the skilled laborers that were needed, but trammers were always wanted. Wages paid for trammers and the contracts made for rock haulage were so high that many miners started tramming because they could make more money at it. A limited number of miners could be utilized at most of the mines, and this would mean the employment of additional trammers. Production of ore has by no means reached the total that might be justified from these properties if the labor situation could be arranged with entire satisfaction to all, but the change for the better is pronounced and constantly improving.

Calumet & Hecla and subsidiaries produced 10,499,711 lb. of copper during November. This is 1,500,000 lb. less than in October. C. & H. accounts for half of the total.

MISSOURI

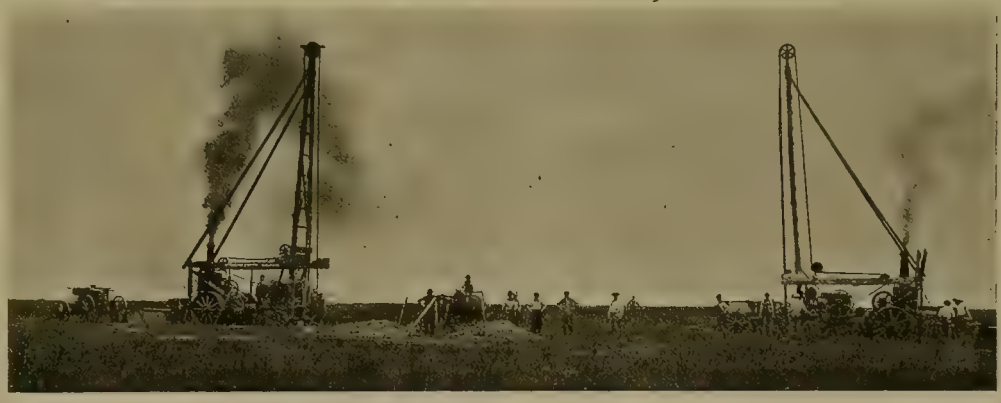
Joplin.—Production of the Tri-State region last week was as under:

	Blende, tons	Calamine, tons	Lead, tons	Value
Kansas	42	..	98	$2,524
Missouri	477	38	85	36,154
Oklahoma	3,775	..	803	234,116

Average prices were $45, $38, and $79 per ton, respectively. The demand was good.

According to E. Z. Eberlein, manager for the Constitutional Lead & Zinc Co., the time was never more auspicious for drill development. He did not mean the development of wild-cat properties, but the blocking-out of proved mines. Just now there is no excuse for heavy production. A good many mines are going to be closed-down entirely, and while they are the managements should, he considered, proceed to block-out their properties carefully and find out just what they have. It is something they doubtless will do sooner or later, and it would be much better to do this now while other operations are quiet.

According to Charles McDonald, speaking to the Joplin 'Globe', "they will all be coming back to this camp [Joplin] to mine before long, simply because they can mine so much cheaper here than they can in Oklahoma, and because there are just as good ore deposits here as there are there. There isn't any question about its being cheaper to mine up here, any of the boosters for Oklahoma will admit that. Usually they have water to fight down there. Then they mine deeper, and that costs extra; and the nature of the ground is such as to make it cost most. And labor is higher; and, most important of all, the cost of getting supplies is much greater. This idea of putting down four or five drill-holes on a tract of land and, if nothing is found, condemning it, is absurd. In the John Jackson ground I saw where the drill had been put down within a foot of bonanza 'dirt' and yet of course it didn't show a thing. That has undoubtedly happened hundreds of times in this field. A drill-hole is about 4 in. diameter, so condemning a tract on account of five blank holes means condemning it because 20 in. out of maybe 160 acres failed to show pay-stuff. This camp was originally developed, not by drillers, but by men with picks and



PROSPECTING FOR ZINC ORE IN THE MIAMI DISTRICT, OKLAHOMA

shovels, who developed by sinking shafts. If we had more of that kind around now we would be developing big mines right along. And even with the drills, we are going to have a lot more good times in this camp, where costs are lower than they are in any other part of this district."

MONTANA

Butte.—The expected strike of the local labor unions did not materialize on December 9. Six of the unions voted to strike as a protest to the sentence imposed on T. J. Mooney at San Francisco. One union voted against and the rest of the unions rejected the proposal entirely. At the last the strike order was cancelled.

Owing to the unsettled conditions of the market, all shipments of custom zinc concentrate from Butte to the electrolytic plant at Great Falls have been stopped. The plant can run to full capacity on the large reserve of concentrate on hand, and what the company's own mines will produce. The Butte shippers were the Butte & Superior Mining Co. and the Timber Butte Milling Company.

Saltese.—A large orebody is being developed on the 1000-ft. level of the Tarbox. It is 8 ft. wide and assays well in lead and zinc, with silver and copper.

NEVADA

Battle Mountain.—South-west of this place, 73 miles, M. D. Farretta and Frank Childress are erecting a 12-retort furnace to reduce their cinnabar. John Ross is superintendent.

Belmont.—The Monitor-Belmont mine is expected to be unwatered to the 300-ft. level by January. At the Belmont and Highbridge shafts water is removed by bailing and air-lifts. Old workings above 200 ft. are being examined and sampled.

Goldfield.—In the Spearhead the raise above the 910-ft. level is up 35 ft. Several good stringers were cut. The cross-cut, out 70 ft., also cut similar ore. The raise has not yet reached the shale-latite contact.

Searchlight.—The Big Casino property near here has been leased for a term of years to the Big Casino Leasing Co., F. E. Sharps, manager. This company is gradually getting the mill in shape to handle 50 tons daily with the first unit, consisting of a Hermann ball-mill, two Deister-Overstrom roughing tables, and one five-compartment K & K flotation machine. Two shifts daily are now running, and the third shift is contemplated in the near future. For each ton of coarse concentrate there is produced one-half ton of fine. Concentrate is treated at the Garfield, Utah, smelter of the A. S. & R. Company.

Herman Wessellhoft's copper mine, 10 miles north-east of Searchlight, is producing 12 to 15% ore carrying considerable glance in a micaceous iron gangue, which is being shipped to Garfield.

Thompson.—Ore received by the Mason Valley smelter here averages 750 tons daily. Sources of this ore are the Mason Valley mine at Mason, the Nevada-Douglas mine at Ludwig, and miscellaneous small producers in this region. Production from the Mason Valley mine is from 300 to 350 tons daily, while that from the Bluestone mine is of nearly equal volume. The Ludwig mine has increased its output to 170 tons daily for the last week. Shipments of blister copper are usually at the rate of three carloads per week. The smelter is still operating only one of its two furnaces. It is said that relief is promised for the shortage of coke, and that prospects of blowing-in the second unit are better. The Bluestone mill is treating 300 to 350 tons daily of sulphide ore by flotation. The carbonate ore is sent to the smelter at Thompson.

Tonopah.—Last week this district produced 7548 tons of ore, valued at $128,316.

The Extension is erecting a steel head-frame at its Victor shaft. This was moved from the old Gwin mine near Jackson, California. A Nordberg hoist is to operate at this shaft.

A raise 65 ft. above the 700-ft. level of the MacNamara has cut the Ohio vein. This is the result of considerable exploration. Shares received much attention on the San Francisco Exchange.

During the period March 20 to November 20, 1918, the Cash Boy Consolidated Mining Co. did 1976 ft. of development. The superintendent, W. C. Hellier, reports that the winze was sunk 93 ft. below the 1434-ft. level, from which nearly all exploration was done, until connection was made between the 1527-ft. level and the shaft. A little ore was extracted near the winze. The main winze followed the vein down for 217 ft. Workings from the winze exposed a fair tonnage. In all, 1740 tons was mined, assaying $23,488 net. The shaft was down 1660 ft. by November. From the 1646-ft. point a block of ground is to be prospected. The physical state of the mine is considered to be in better condition than ever before. Cash on hand amounts to $8341.

Production of the principal mines in November was as under.

Mine	Tons	Silver, oz.	Gold, oz.	Profit
Tonopah Belmont	7,944	103,971	1,064	$59,639
Tonopah Extension	9,598	116,717	1,082	53,797
Tonopah Mining	14,900	69,500	770	13,800
Jim Butler	690	.....	....	2,629
West End	....	110,632		.....

OKLAHOMA

Douthat.—A 500-ton (per shift) mill on the Admiralty Zinc Co.'s land, operated by R. Munson and J. J. McLellan, is making good profits treating tailing. Four tons of high-grade concentrate is made per shift, while total costs are only $100.

Picher.—Production of the fields last week totaled 3775 tons of blende and 803 tons of lead, valued at $234,115.

TENNESSEE

Copperhill.—In the suit of the former Russian government against the Tennessee Copper Co., claiming $1,368,000 for non-delivery of some high explosives in 1915, the company has deposited $1,000,000 in New York as a settlement. This cannot be collected as there is no stable government in Russia.

UTAH

American Fork.—The high-grade body of lead ore in the Belorophon mine persists and grows stronger, according to the manager of the Globe mine adjoining.

Bingham.—Utah Consolidated paid 25c. per share, equal to $75,000, on December 24. This makes $1.50 for 1918 and $3.50 for 1917.

Green River.—The U. S. Geological Survey has just reported the results of a reconnaissance made by J. T. Pardee, of 400 square miles in the Green River district south of the Denver & Rio Grande railroad, between Thompson and Green River. The work done included a thorough examination of 20 manganese mines, and a detailed survey of 4 square miles in the vicinity of the Colorado Fuel & Iron mine, made in order to facilitate a close estimate of the ore-reserves.

The manganese ore occurs as irregular lenses or blankets that lie a few feet below the surface along the bedding planes of a gypsiferous, calcareous, red sandstone near the middle of the McElmo formation (Jurassic?); as veins and nodular concretions along joints below the blankets; and as fragments in the soil, residual from the weathering of ore of the two forms first mentioned.

Most of the mines in this district were operated part of the time during 1916 and 1917. At present three operators are producing 400 to 600 tons of high-grade manganese ore per month. Most of this ore comes from the C. F. & I. and Salt Wash mines, operated by the Green River Mining Co.

The other active operators are the Needles Mining Co. and J. B. Fonder.

The deposits are worked solely by open-pits. The bedded deposits (blankets) bear an overburden ranging in thickness from a few inches to 6 ft., which is stripped off by hand or with plow and scraper. It is rarely profitable to mine them by driving under cover or to remove more than 6 ft. of overburden. Residual fragments of manganese ore are separated from the soil by dry screening and hand picking.

At the C. F. & I. mine a revolving-screen, driven by a gasoline engine, has been discarded for one-man hand-shaking screens and stationary sloping-screens such as are commonly used by mortar-mixers to clean sand. In this way one man can produce from 1000 to 2000 lb. of ore per day. The quantity of ore produced from the blankets by one man is variable, but averages nearly the same as that obtained from the residual deposits.

Miners' wages are $3.75 and $4, and board is $1.25 per day. The cost of hauling ore to the railroad from the C. F. & I. mine is $4 per ton, and the cost at the other mines ranges from $4 to $9. Loading, hauling, water, and other expenses bring the cost of a ton of ore on board the cars up to a price ranging from $17 to $25. The operators report difficulty in obtaining sufficient labor to work the mines at full capacity. It is estimated that a monthly output of at least 800 tons can be maintained during the remainder of 1918 without modifying existing methods of mining or adding greatly to the equipment on hand, if a sufficient number of miners can be had.

On May 20, 1918, there were 262 tons of ore on the loading platforms at Crescent and Floy awaiting shipment. Approximately half of this was selected ore carrying about 80% MnO_2, a grade known as 'di-oxide' ore by the operators. The remainder carries more than 40% Mn, and is classified by the operators as 'furnace' or 'metallic' ore.

Mr. Pardee estimates that 7300 tons of high-grade ore (containing more than 40%) is available for mining under present conditions and without modification of existing methods. Most of this may be classified as furnace ore, though a considerable part of it could be hand-sorted to di-oxide ore. About two-thirds of the quantity estimated is contained in the blankets and the remainder in the residual deposits. The above estimates include 20 mines, two of which supply more than half the total. In addition, 22,500 tons, chiefly in the residual surface deposits, are possibly available to mining under improved conditions or methods. Some way other than hand-picking should be devised to separate the rock fragments from the ore.

Under present conditions the ore in the Green River district that contains much less than 40% Mn cannot perhaps be mined profitably, but such ore happens to be not very abundant. About 5000 tons of ore containing from 15 to 40% and considerable lime is available for mining. In addition there is a considerable amount of ore containing smaller quantities of manganese and much silica, most of it in abandoned claims at what is known as the Court House.

Park City.—The Judge M. & S. Co. paid 12½c. per share, equal to $37,500, last week. This makes $240,000 for 1918.

Salt Lake City.—Protest against the collection of a tax on the net earnings of mining companies by the State Treasurer was made in the District Court on November 13, when more than twenty of the more prominent mining companies of the State filed actions seeking to restrain the State Treasurer from collecting any but the occupational tax and asking for an injunction to prevent the sale of properties to satisfy the taxes.

The law against which protest is made provides for a tax of $1 per annum from all concerns or individuals engaged in mining business in Utah and an additional 2% per annum on the net proceeds, with the exception of the taxes for 1917, which are now being collected on the basis of 3% on the net proceeds. In the complaint the constitutionality of the law is questioned as a violation of the Constitution of the United States, the fourteenth amendment to the Federal constitution and the State constitution. The fourteenth amendment prohibits the confiscation of property without due process-of-law. It is maintained that the occupational tax and the tax on net earnings constitutes double taxation, because it taxes the proceeds at a greater rate than is imposed on other taxable property in the State, in violation of Sections 3 and 4 of Article 13 of the State constitution. It is further maintained that the law subjects the mines to a tax for a definite purpose in excess of that which is imposed upon other taxable property, and deprives the owners of their property without due process-of-law, and that the action of the State Treasurer, if permitted to sell the properties as he has advertised, will place the title to the properties in doubt.

Among those joining in the suit are the Utah Copper Co., the Judge Mining & Smelting Co., and the Silver King Consolidated Mining Company.

A preliminary hearing in the matter was held by Judge T. D. Johnson, in the Federal Court, on the 14th, to decide on the question of temporary injunction.

WASHINGTON

Newport.—A 100-ton concentrator is being erected by the Bead Lake Copper Co. on the Pend Oreille river north of Newport.

Spokane.—E. S. Campbell and associates of Spokane have taken an option for $200,000 on the Crystal property in Lincoln county, 35 miles west of this place. The Crystal was located 23 years ago by John Gray of Spokane, who has since carried on some development.

CANADA

British Columbia

Ainsworth.—The Florence Silver Mining Co. paid a Christmas dividend of 1 cent per share, equal to $10,000. The mine produces lead-silver-zinc ore.

Hedley.—The Hedley Gold Mining Co. pays 15c. per share, $18,000, on December 31.

Sandon.—The manager of the Queen Bess Mining Co., O. A. Thomas, reports that the concentrator being erected at that property is almost ready. During the past eight months $50,000 of machinery has been purchased. The Queen Bess is a silver-lead-zinc mine, located in 1895. Until a short time ago it lay dormant. The steady development that has proceeded for the past two years has given the company considerable ore-reserves. A shaft has been sunk a depth of 300 ft., which Mr. Thomas says proves the persistence of the orebodies of the district.

Manitoba

Le Pas.—According to the contractor for hauling ore, C. B. Morgan, 10,000 tons was shipped from the Mandy mine in the Flin Flon district this season. The company is to double its output.

Ontario

Cobalt.—The Nipissing company produced silver worth $281,078 during November. At the high-grade mill 181 tons yielded $109,461, and at the low-grade mill 6345 tons returned $171,617. The refinery handled 401,552 oz., including custom metal. The total output for 11 months is $3,280,672, almost equal to the whole of 1918. In a winze being sunk on vein 544 on No. 6 level of No. 73 shaft, at a depth of 35 ft. there is 2 in. of 1200 to 2000-oz. ore. A cross-vein at some depth assays 1500 oz. across 1½ in. General conditions underground are favorable.

Kerr Lake produced 169,491 oz. of silver during November.

Following the dispute between La Rose company and O'Brien, G. E. Booth, connected with the La Rose, has

staked what is purported to be a fraction between the Violet and O'Brien properties. The staking was done on November 5, and application to record was filed with the Mining Recorder on the 20th. The fraction applied for is a strip, about 160 ft. wide on the north end, running down to a point on the extreme south end. In the staking is the Violet shaft and part of the workings underground, besides buildings on surface. This opens a new phase of the dispute regarding the boundary. M. J. O'Brien Limited applied for a declaration by the Supreme Court of the rights of themselves and the La Rose company some days ago. It was thought that an injunction was the next move, but the 'Northern Miner' is informed that the proceedings will be commenced without an injunction.

The Hudson Bay Mines company has issued its report for the year ended August 31, 1918. The company has a mine at Cobalt, the Dome Lake at Porcupine, and claims at Gowganda and Kirkland Lake. No work was done at the last named. The Dome Lake is developing fairly well. Cyanidation was added to the amalgamating plant, increasing extraction 25%, to 87%. Ore-reserves in the Cobalt mine total 12,224 tons, containing 60,149 oz. of silver. The mill treated 20,540 tons of 9.5-oz. ore, extracting 72,502 oz. The profit was $32,402, which, added to the previous balance, makes $132,636 at credit. Mining and milling cost $4.493 per ton.

KOREA

Unsan.—Oriental Consolidated reports the clean-up for November yielding $122,000.

MEXICO

Chihuahua

Parral.—The Alvarado M. & M. Co. is to increase its mill capacity from 500 to 600 tons daily. The present output is $200,000 of silver monthly. According to the general manager, T. G. Hawkins, in a statement to the El Paso 'Herald', "We are working three groups of properties—the Palmilla, Las Cruces, and Veta Colorado. For the first named we have shipped the centrifugal pump of 1500 gal. per min. The mine makes 1200 gal. This pump is to handle the water in the new shaft of the Palmilla, 200 ft. below our old 600-ft. level. On the Veta Colorado we have put the Alfarena shaft down to 900 ft., have thoroughly prospected ground below water with diamond-drills, and discovered large bodies of high-grade ore. We have found ore running as high as 30 kg. (960 oz.) per ton. One very large body, principally of milling ore, is 40 ft. wide, with rich streaks. At the bottom of this shaft, which is in the foot-wall, we have just installed a 200-hp. centrifugal electric pump to handle the water. We have cross-cut from this shaft to within 15 ft. of the vein, and will begin immediately to pump this new ground. Our company is milling only its own ore. We use the cyanide process, and our silver is 859 fine. We have three aerial tramways for ore transportation from the mines to the mill. A. W. Morris is metallurgist, and Fred Marston, mill superintendent."

Cusihuiriachic.—Villa's main command, which passed through this place on December 18, destroyed property of the Cusi Mining Co. valued at $20,000. The American officials escaped before Villa arrived.

Tamaulipas

Tuxpam.—The Potrero del Llano gusher of the Aguila Oil Co. is reported to have ceased yielding oil. For over 8 years it has produced 50,000 bbl. daily, the limit that could be conveniently handled. When 'brought-in' the output was 120,000 bbl., which was maintained until recently. The depth of this well was 3200 ft. The oil was conveyed to ships, 6 miles out in the gulf, by the submerged pipe-line and floating loading-station that has frequently been described.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments The information is interesting to our readers.

Pope Yeatman has returned from France to New York.

Spencer C. Browne, Jr., has returned to New York from San Francisco.

Robert C. Gemmell, manager for the Utah Copper Co., is in San Francisco.

Aubrey S. Wheler sailed on the 'Siberia Maru' on December 21 for Shanghai.

S. Herbert Williams, now resident at Ely, Nevada, spent last week in San Francisco.

W. L. Creden has resigned as manager for the Davis-Daly Copper Co. of Butte, Montana.

P. A. Robbins has opened an office as consulting engineer in the Hobart Bdg., San Francisco.

Mark R. Lamb sailed from New York on the 'Adriatic' on December 23, on his way to France.

H. S. Mudd, who has been serving with the U. S. Bureau of Mines, has returned to Los Angeles.

R. K. Humphrey is general manager of the Belle Union and New Mohawk mines, at Chloride, Arizona.

W. T. Pearce, of the Marranboy Tin Fields Company in the Northern Territory of Australia, is at the Whitcomb hotel.

J. Power Hutchins, having entirely recovered from a severe attack of influenza, has returned from San Francisco to New York.

D. M. Folsom has been appointed assistant to the president of the General Petroleum Corporation, Capt. John Barneson.

N. H. Emmons has left the Air Nitrates Corporation to resume consulting practice, establishing himself at Lynchburg, Virginia.

G. L. Carlisle, Jr., who has been working with the Emergency Fleet Corporation, has returned to engineering practice at 14 Wall St., New York.

Walter Broadbridge, Captain in the British Army, metallurgist and mining engineer to Minerals Separation Ltd., London, is at the St. Francis hotel.

E. K. Soper, formerly Dean of the Oregon School of Mines, has resigned his position at that institution, and will go to the West Indies on a geologic reconnaissance.

E. B. Thornhill has resigned as manager of the New York office of the General Engineering Co. to become research engineer for the Chino Copper Co. at Hurley, New Mexico.

H. R. Plate has returned from a business trip to New York. Mr. Plate and his associates are forming an exploration company to operate the Sheep Ranch mine in Calaveras county, California.

E. E. Campbell, superintendent of the Anyox B. C. mine of the Granby Consolidated Mining & Smelting Co., and **O. B. Smith,** general superintendent of the company's mining operations, have returned to Anyox after visiting the Ketchikan district of northern British Columbia.

W. H. Staver, who superintended the Liberty Bell at Telluride, Colorado, for a number of years, has returned to New York from Brazil and opened an office at 15 Broad street. While in Brazil he acted as mine manager for E. J. Lavino & Co., in the Bomfim, Santa Luzia, and Saude districts, in the State of Bahia.

The postponed meeting to organize a local chapter of the American Mining Congress in San Francisco will be held on January 15 and 16. An interesting program is being arranged.

THE METAL MARKET

METAL PRICES

San Francisco, December 24

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	10.00
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	6.75— 7.25
Platinum, per ounce	$108
Quicksilver, per flask of 75 lb	$110
Spelter, cents per pound	10.00
Zinc-dust, cents per pound	16.00

ORE PRICES

December 24

Chrome, no definite quotations available.	
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% MoS_2	$0.85
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, per unit	$17—$23

EASTERN METAL MARKET

(By wire from New York)

December 24.—Copper is inactive. The official price is 26 cents, but re-sale offerings are 23 cents. Lead is dull and lower. The market was declared open on the 21st. Spelter is lifeless and easy.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15 On August 7 the current rates were again fixed until November 1, which have since been extended to January 1, 1919, prices to be effective on the day of shipment, not the day of sale. Quotations in cents per pound are as under:

Re-sale copper is said to be offered as low as 19c. per lb. in large quantities by consumers who have stocks, the result of cancellation of orders.

Leading copper producers on December 17 formed the Copper Export Association. The capital is $250,000 in 7% preferred stock and 500 common shares of no par value. John D. Ryan is president. The object of the Association is for producers to unite to facilitate foreign trade. This is permissible under the Webb law.

LEAD

Lead is quoted in cents per pound, New York delivery. Early in July, producers agreed to fix prices at 8.05c. per lb., New York. This was reduced to 7.05c. on December 2. On the 21st all restrictions were removed from lead, the market now being free.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government fixed its maximum at 49½ pence, on September 2, but on November 12 this was changed to 48¾ pence, due to a drop in price.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government was taking 40% of the United States quicksilver output, paying therefore $105 per flask, and will continue to pay this until contracts are completed. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

TIN

Prices in New York, in cents per pound. The monthly averages in 1918 are nominal. Under the international agreement, the United States is to get 66% of the world's supply of tin; but this control ends on January 1, 1919. On December 3 the War Industries Board fixed the price to consumers and jobbers at 72½c. f.o.b. Chicago and Eastern points, and 71¼c. on the Pacific Coast.

Manganese Alloys: There has been no test of the market, there being no demand. Quotations are unchanged at $240 to $250, delivered, for 70% ferro and $70, furnace, for 16 to 22% spiegel. A representative here of a British ferro-maker has secured a license to import over 1000 tons of British alloy to apply on an old contract.

Eastern Metal Market

New York, December 18.

The trend of events points to entirely free markets in all the metals after January 1, except possibly in the case of tin.

There is no buying of copper.

The tin market is lifeless and in a state of readjustment.

The lead market has fallen on account of offerings of re-sale metal.

The zinc market is entirely flat, but the tone is steady.

Antimony has declined on more liberal offerings and less demand.

An open market in steel is the outcome of the recent meeting at Washington between the War Industries Board and the steel-makers. A suggestion from the latter that a lower maximum-price schedule prevail for the first quarter was rejected. Automatically the market becomes an open one, and already 6000 tons of plate has sold at 3c. per lb. for January delivery, or ¼c. under the Government maximum price. Some steel companies refuse to recognize any lower schedule, but all indications point to lower levels in steel products in particular. Pig-iron makers feel that they will be able to continue to get the old prices. The new prices, or those that were to have been proposed, are from $3 to $5 per ton lower than present Government levels.

COPPER

A meeting is scheduled for Friday, December 20, at Washington, between the Copper Producers' Committee and the War Industries Board as to the future control of the market after January 1. Judging by the recent course of events in the steel market, where all control has been abandoned, a like issue is expected in copper and an open market will probably prevail before the beginning of 1919, if not earlier. The fact that an agreement exists that the price of copper be maintained at 26c. until January 1 renders any sales under this level unlikely, yet it may occur. At present there is no demand at all, and the market is lifeless. The Government has let it be known officially that any stocks of copper it may have in hand will not be thrown on the market so as to unstabilize it, or in other words, the Government will not be a competitor with producers. This has been an encouraging factor in the situation, for it is known that the Government has large unused stocks in its possession. It is probable that producers will be able to stabilize the market after January 1, for a time at least, their experience under war conditions standing them in good stead. One large dealer expresses the opinion that the market may recede for a time, then gradually advance to a stable price-level. Stocks of refined metal in the country are undoubtedly large, estimates placing them as high as 800,000,000 pounds.

TIN

So far as international control of the tin market is concerned, this may be said to have ceased. The Tin Executive in London has ceased to function as a purchaser, and all allocations of metal there have been abandoned. The entire scheme of international control ends officially on January 1, but so far as the United States is concerned this may not be said to be true until all the metal that has been allocated to the United States Steel Products Co. has been disposed of to consumers at cost. Left to the usual channels and under present conditions with consumers well stocked, this would take a long time. It may now be said that Tin Importers' Association here has offered a plan to the War Industries Board whereby the entire problem is capable of more rapid solution. By this scheme a survey of stocks on hand and to arrive is to be made, and then an estimate made of the time necessary for consumption. If this should figure out to be April 1, then future tin buying could begin through importers' channels; but each consumer would have to buy as much prompt tin from the U. S. Steel Products Co. as he desires of future tin, receiving at the same time a certificate of purchase for the former. In no other way could he buy future tin. Such certificates under the plan could be made negotiable so that a consumer not needing prompt tin could sell his certificate and thus reduce the cost of his purchases. It is believed that some such plan may be adopted, and the entire market gradually brought back to its previous status. Consumers are not coming into the market and taking freely metal from the U. S. Steel Products Co.; they are apparently well stocked. Demand for prompt metal is light, and such light sales of re-sale metal as have been made have gone at 72c., New York, which is the nominal market. The fixed price of the tin allocated to this country and in the hands of the U. S. Steel Products Co. is 72.50c., New York and Chicago, and 71.25c., Pacific ports. Arrivals so far this month have been 1600 tons at Pacific ports and 30 tons at Atlantic. Future standard tin is quoted in London at £269 per ton.

LEAD

The market is lifeless and presents a decided contrast to that of only four or five weeks ago. Then a maximum price of 8.05c., New York, ruled, and the metal was scarce. Now an agreed price of 7.05c. is disregarded, and re-sale metal in the hands of consumers is being offered as low as 6.40c., St. Louis, or 6.75c., New York, with no one desirous of buying it. We quote the market as nominal at these levels with the official maximum price at 7.05c., New York, or 6.75c., St. Louis. It is probable that prompt metal could be bought today at 6.75c., New York. The control of the market, which is still technically in the hands of the Lead Producers' Committee, will probably cease January 1.

ZINC

Buying by galvanizers has subsided, and brass-makers are entirely out of the market. As a result the market has become very dull. Prime Western for early delivery is quoted largely nominal at 8.15c., St. Louis, or 8.50c., New York, with first quarter at about 7.85 to 8c., St. Louis, or 8.20 to 8.35c., New York. The maximum price of 12c. per lb. for grade A zinc will disappear on January 1, as well as those of 15c. and 14c., respectively, for sheet and plate-zinc. It is understood the Government has large stocks of grade A on hand which it will not indiscriminately put on sale so as to unduly unsettle a normal readjustment.

ANTIMONY

This market has again declined, due to fairly large offerings of wholesale lots for December, January, and February delivery. It may now be quoted at 8 to 8.25c., New York, duty paid, for prompt and early delivery.

ALUMINUM

While ample supplies of metal are being allocated to domestic uses, Government maximum prices continue to control the market at 33c. per lb. for 50-ton lots, at 33.10c. per ton for 15 to 50-ton lots, and at 33.20c. per ton for 1 to 15-ton lots.

TUNGSTEN

It is stated that representatives of ore consumers, sellers, etc., made a recommendation to the War Trade Board that a duty be imposed on imports of ore and that none be imported for at least three months. This was refused them.

Note: Companies not included in the above list are requested to submit details. Changes in capitalization and new dividends will be entered on receipt of the information. This table will be published quarterly.

Company Reports

MOUNT LYELL MINING & RAILWAY CO.

Property: mines, railroads, and smelters at Queenstown, Tasmania; a group of mines near Zeehan, Tasmania; acid and super-phosphate works near Melbourne and Fremantle, Australia.

Operating Officials: Robert C. Sticht, general manager; Basil Sawyer, local superintendent; R. M. Murray, engineer in charge of mines; R. P. Roberts, chief metallurgist; G. W. Wright, chief mechanical engineer; E. C. Driffield, engineer for railways; and H. J. Clarke, engineer for supplies.

Financial Statement: during the year ended September 30, 1918, sales of copper, pyrite, chemical works profit, and railroad traffic realized £916,086 ($4,396,800). The operating profit was £455,899 ($2,189,000); less office expenses, depreciation (£50,397), taxes (£64,403), new plant, etc., leaving a balance of £247,229 ($1,185,000). After paying dividends the balance forward was £274,432 ($1,315,000), including £236,697 ($1,137,000) from 1917.

Dividends: two (No. 24 and 25) absorbed £209,494 ($1,005,000).

Development: in the Mt. Lyell mine some drilling was done, proving the downward continuation of the South Lyell orebody. Results in the North Lyell were generally satisfactory. The Lyell Comstock sent 15,607 tons to the flotation plant. Ore-reserves are as under:

Mine	Tons	Copper, %	Silver, oz.	Gold, oz.
Mount and South Lyell	2,028,747	0.49	1.48	0.040
North Lyell	1,036,300	6.00	1.33	0.005

Production: the smelter reduced 240,947 tons of ores, yielding 13,031,520 lb. of copper, 320,344 oz. of silver, and 7042 oz. of gold. The flotation plant dressed 29,703 tons of 2.95% ore, giving 88.06% recovery. Concentrate was sintered for smelting. All costs were $7 per ton of ore, a rise of 62 cents.

BROKEN HILL PROPRIETARY CO., LTD.

During the half-year ended May 31, 1918, the report being just to hand, this Australian company made a profit of £372,310 ($1,785,000). Two dividends—No. 180 and 181—absorbed £118,100 ($566,000). Excess of assets over liabilities totals £845,546 ($4,060,000).

The dressing mills at Broken Hill handled 70,843 tons of ore, 117,133 tons of old tailing, 144,944 tons of zinc tailing, and 73,991 tons of slime. The approximate metal output was 13,500 tons of lead, 9600 tons of zinc, and 1,050,000 oz. of silver. Sulphuric acid made amounted to 4254 tons.

The Iron Knob quarry produced 164,780 tons of iron ore, which was sent to the Newcastle works. These made 67,803 tons of pig-iron, 89,011 tons of steel ingots, 47,380 tons of rails, plates, etc., and 74,025 tons of coke.

AMALGAMATED ZINC (DE BAVAY'S), LTD.

Property: flotation works at Broken Hill, Australia, treating tailing purchased from adjacent mines.

Operating Officials: David Meredith, general manager; A. J. F. de Bavay, consulting chemist.

Financial Statement: revenue for the half-year ended June 30, 1918, totaled £417,155 ($2,002,000). The profit was £101,668 ($489,600). The surplus of liquid assets amounted to £151,055 ($724,800).

Dividends: three of £25,000 each totaled $360,000.

Works Operation: the plant dressed 164,719 tons of tailing, yielded 47,184 tons of concentrate assaying 48.2% zinc, 6.4% lead, and 9.1 oz. silver; and 1834 tons containing 53.2% lead, 12.5% zinc, and 65.9 oz. silver per ton. The plant treated just 1000 tons daily.

Eleven mines in the Far East Rand contribute 60% of the profits of the Witwatersrand, compared with 40% from thirty-eight in the remainder of the goldfield.

INFORMATION FURNISHED BY MANUFACTURERS

RECENT DEVELOPMENTS IN FINE GRINDING

About ten years ago users of pulverizing machinery became interested in several high-speed grinders that were claimed to be more efficient as finishers than flint-pebble tube-mills then in general and satisfactory use for that purpose. While it is generally admitted that flint-pebble tube-mills as then built are superior, as fine grinders, to any high-speed machines then and now obtainable, the small wear-resisting metallic-grinding medium 'ball-pebs' since introduced has so greatly increased its efficiency that it stands today without a rival as a fine grinder for cement and other abrasive substances.

To obtain in full measure the advantage of this great improvement required carrying the grinding charge as heretofore, at about the centre of the mill. This increased the weight of charge 2½ times. Allis-Chalmers engineers, quick to recognize the importance of this great improvement, were the first to develop and manufacture the 'ball-peb mill', with parts adequately designed to take full advantage of this great step in advance in grinding practice. This still left the problem of adapting existing mills to the use of ball-pebs. Some of the methods tried were as follows: (1) Many operators simply substituted for the flint pebbles an amount of ball-pebs that would not over-strain the mill or its driving connections. In time, as a further improvement, ribbed liners were substituted for silex or smooth iron liners previously used with flint pebbles. This method, though not obtaining maximum results, gives better efficiency than flint pebbles. (2) In some cases mills were reconstructed to carry the heavier loads. While this is satisfactory in operation, the first cost is necessarily high. (3) Another alternative is to reduce the inside diameter of mill to such size that when charged to the centre the mill and its driving connection are not over-strained. The principal objection to this method is the recognized lesser efficiency of smaller diameter mills. (4) Another alternative is the use of division heads to blank the centre of mill and carry the ball-pebs to near the centre in two ends. This method also gives satisfactory results, but necessarily introduces additional wear on the two division heads.

Until recently small spheres, cylinders, nut and boiler punchings, have been the most common forms of metallic grinding bodies. Efforts have been made to improve on these by studying and experimenting with special shapes. Laboratory experiments showed that boiler punchings of much greater diameter than thickness ground more efficiently than spheres of ordinary cylinders from feed 75% through 200-mesh to discharge 80% through 200-mesh; but, for grinding from minus 20 or minus 30-mesh, spheres, because of their greater weight, rolling and pounding action, were more efficient than cylinders or boiler punchings that have principally a sliding action. The first experiment showed the necessity of area of contact and the latter that for customary grinding, rolling and pounding is necessary to reduce the larger particles.

An entirely new product, the 'Concavex', resulted from the effort to combine in one body these two essential features. As its name implies, it has both concave and convex surfaces, the preferred shape of manufacture being a sphere with two sides cupped, forming concave surfaces with radius about the same as the sphere. Concavex are made in various diameters, size of feed and desired fineness of product determining the diameter to be used. In cement-mill practice the 1¼-in. concavex are the best substitute for the ¾-in. ball-pebs. The large contact area, due to their shape, gives them great efficiency. Their peculiar shape tends to eliminate shrinkage strains, thus permitting the use of much harder mixture without sacrificing strength. Of greatest importance to users of flint-pebble tube-mills, is that with concavex the expensive reconstruction necessary to use metallic grinding bodies efficiently in such mills is eliminated. On account of their interlocking shape their angle of repose is greater; consequently, a low charge is carried higher in the mill, and therefore attains the rolling action found in mills charged to the centre-line, and without over-straining the mill or its driving connections, thus offering a means heretofore unavailable to convert such mills to efficient grinders at reasonable first cost.

ELECTRIC HOISTS IN THE SERVICE

By James Monroe

During the War, the machine-shop manager had to depend greatly upon mechanical means for increasing his output. With long deliveries on machine-tools, their purchase meant no immediate relief. He had to cut down the time spent in handling raw material and finished product through the shop. There are three distinct phases to this problem: (1) Unloading raw material from cars; (2) carrying material and parts through the shop between operations; and (3) loading the finished product on the cars.

A satisfactory and efficient method of shortening these

Fig. 1

operations, and also reducing their cost is the application of the electric hoist made by the Link-Belt Co. of Chicago.

Fig. 1 shows one of these machines unloading pipe from a gondola car. This class of material, and plates and shapes as well, may thus be handled with the greatest ease.

Hoists simplify the handling problems throughout a plant i many ways. Motor-trucks were of immense importance in all departments of the Army. One of the overhead cage-

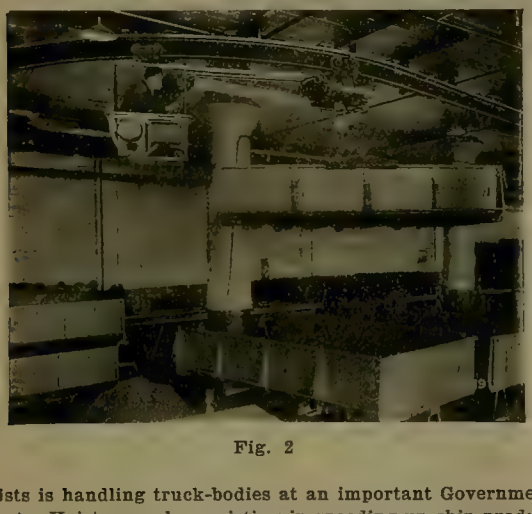

Fig. 2

hoists is handling truck-bodies at an important Government plant. Hoists are also assisting in speeding-up ship production, and in the Navy yards.

With the great scarcity of cars, and high demurrage rates, quick loading has been vital. For loading gondolas, the load may be brought directly over the car, and then lowered. A well-known manufacturer of Government truck-bodies has seen in the mono-rail hoist system an ideal method. Fig. 2 shows the runway. The operator has just lifted a body from the storage-pile, and is ready to carry it out over the car. This track system is in the shape of the letter U. The curved part covers the storage area, while the two straight sections run over two parallel sidings. This is an important link in the production system.

The electric hoist did not need the War to bring it into the public eye, but its scope has broadened, and it has shown some of the war industries how to operate intensively and efficiently.

COMMERCIAL PARAGRAPHS

The Chicago Pneumatic Tool Co. announces the appointment of L. C. Sprague as assistant secretary with headquarters at 52 Vanderbilt avenue, New York.

The Meyer dry-ore concentrator, made by the National Milling & Refining Co. of Canton, Ohio, is described in a bulletin recently issued. This machine was fully discussed in the 'Press' of May 4, 1918.

The W. A. Zelnicker Supply Co. of St. Louis announces the appointment of Joseph Meyerson as secretary to the president. He was associated for 10 years with the Southwestern Tariff Bureau.——Mr. Kottsieper has recently joined the traveling force of this firm and will make the South-Western territory.

The Milliken Brothers Mfg. Co., Inc., Woolworth building, New York, has just published a new illustrated book, entitled 'Space and Speed in Steel Buildings', giving a description of the standardized truss-unit system of building construction, designed and manufactured by the company. This system of erection is suitable for all classes of industrial and manufacturing buildings, making use of a simple common structural-steel unit both for columns and trusses. No plans are necessary, and the buildings are either permanent or portable. The system makes possible low transportation and erection costs. The book shows a number of interesting halftones, illustrating different buildings of this type constructed for the United States government. Copies may be obtained free from the company by those interested.

On page 16 of the advertisements in the 'Press' of December 7 the **General Engineering Co.** of Salt Lake City stated that the Callow pneumatic flotation plant was "now making a 98% recovery (by the month) in the form of an 80% MoS_2 product at the Dominion Molybdenite Co.'s mill, at Quyon, Quebec." The firm writes us that it was in error, and the note should have read "a 95% recovery in the form of a 93% MoS_2 product."

The American Zinc, Lead & Smelting Co. of St. Louis, Mo., has published a 35-page booklet on its 'Azo' zinc oxides. The information is useful for paint and varnish manufacturers. After experimenting for two years the company entered this field late in 1917. The products are made at Hillsboro, Illinois. They show highly desirable qualities by analysis, and only contain from a trace to 0.02% sulphur di-oxide and 0.2 to 0.5% zinc sulphate, both undesirables.

Price-list No. 18 for **du Pont black blasting powder** has been issued. The prices were effective December 13, 1918, and f.o.b. Pacific Coast points. In carload lots (800 kegs) the price is $1.90 per keg, for 100-keg lots $2.20, for 10-keg lots $2.30, and less than 10-keg lots $2.45 each. In the high-explosives list, effective same date, the strengths from 20 to 60% are given as so much per carload, ton, or less than ton. The San Francisco office is at the Chronicle building.

Since H. W. Hardinge of the **Hardinge Conical Mill Co.** acquired a considerable interest in the **Denver Engineering Works,** some important changes have been made relative to district offices: R. B. T. Kiliani, secretary-treasurer of the Hardinge company, has been elected vice-president and treasurer of the Denver Engineering Works, and is a director of that company. His office will be at First National Bank Bdg., Denver. V. A. Stout, sales engineer, has removed his office from San Francisco to Salt Lake City. With him will be W. L. Penick, formerly with the Granby Consolidated M. & S. Co. at Anyox, B. C. Mr. Penick has been acting as sales engineer for the Hardinge company for several months. Some changes in the organization of the Denver Engineering Works Co. have been made within the last two or three months: Lewis Searing has resigned as vice-president to go East. His position has been filled by W. W. Torrence, formerly with the General Electric Co. at Denver. Alfred Tellman, formerly metallurgical engineer and superintendent at the plant of the Ridder Mining Co. in Siberia is in charge of the engineering work connected with the sale of milling equipment. Mr. Kiliani of the Hardinge company will handle all the sales business for the Denver Engineering Works in so far as it relates to milling equipment.

When two contiguous groups of mining claims are owned in part by the same people, but also having other owners of one group who are not owners in the other, it is unsafe to perform assessment work for all claims of the two groups by means of group work done on one group alone. The difficulty can be remedied easily, however, by a joint agreement between the owners of both groups providing that the assessment work done on one group shall be for their common benefit. This year of course the claimants can file with the County Recorder notice of their desire to take advantage of the Act of Congress providing for the exemption of claims from assessment work during the year 1918.
